

Experimental ensemble forecasts of precipitation based on a convection-resolving model

C. Gebhardt, S. Theis, P. Krahe, V. Renner

precipitation forecasts are

- essential for hydrological applications
- generally uncertain
- are based on atmospheric models

This study

- uses the new high-resolution COSMO-DE model to develop experimental ensembles
- estimates uncertainty of precipitation forecasts (model error, boundaries)
- will estimate the impact on hydrological uncertainty (future plan)
