

IV Use of probabilities

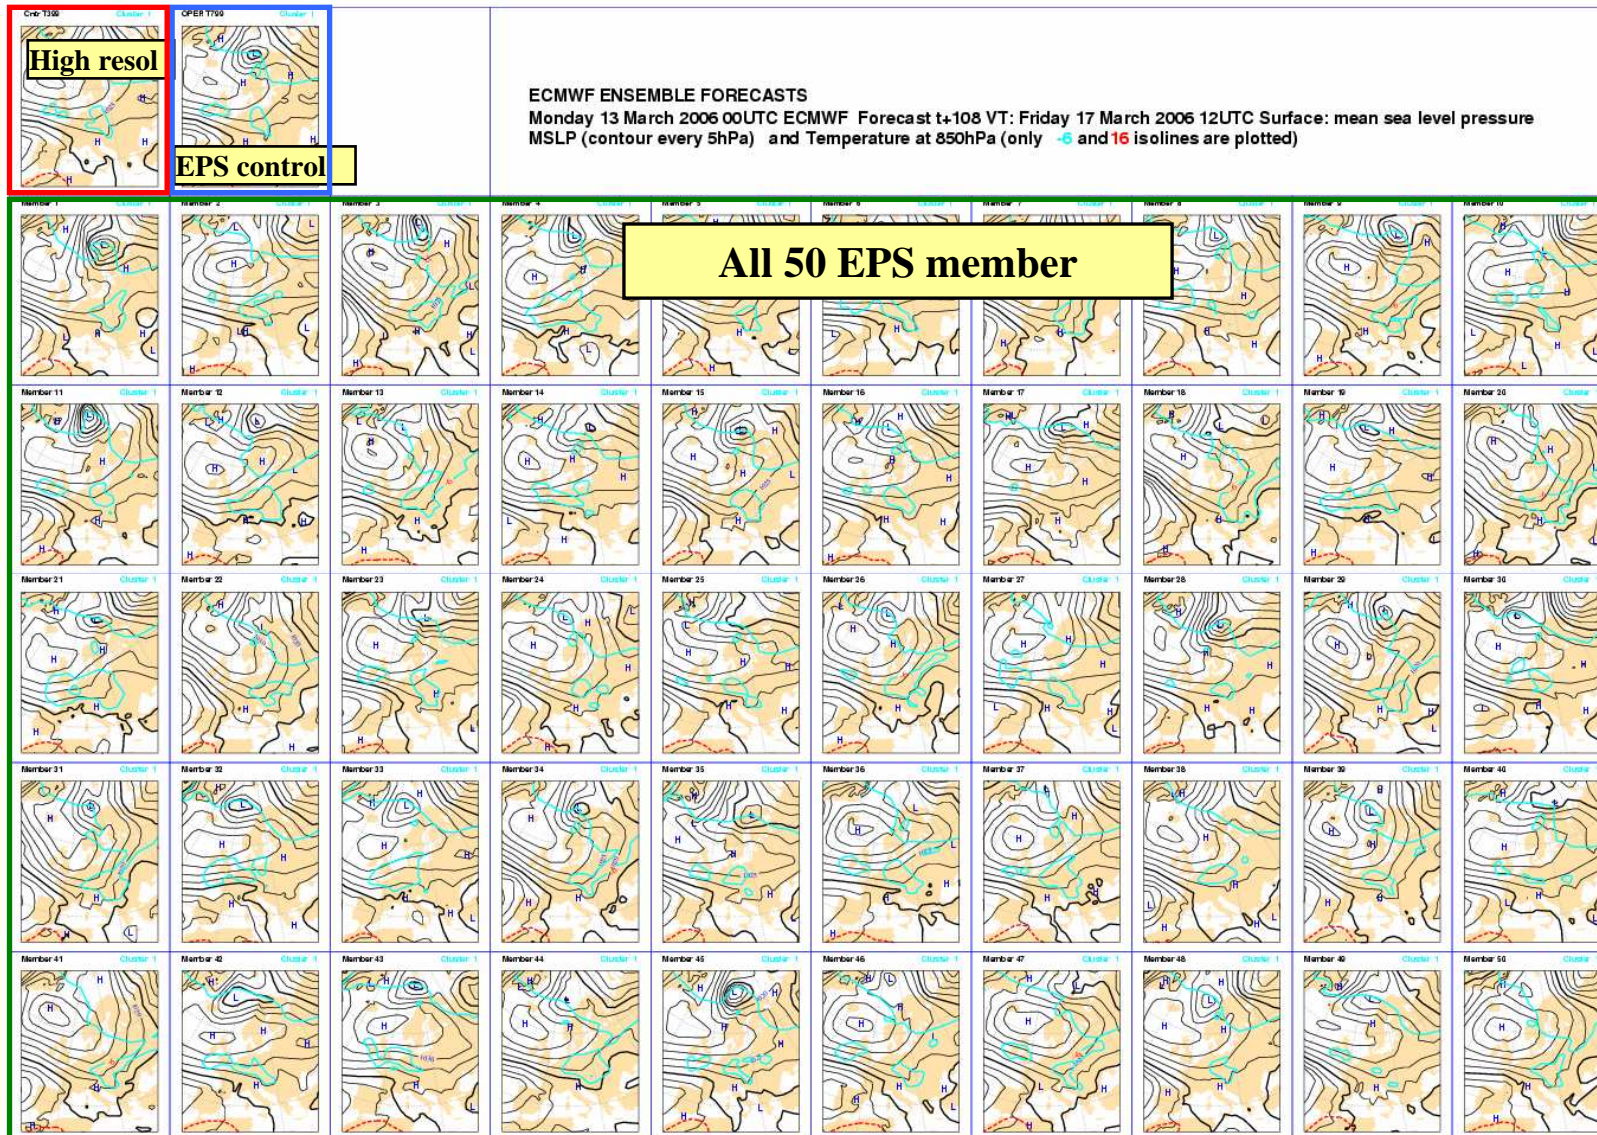

4. Probability products

EPS products

- Ensemble Members and clusters
- Ensemble Mean and Ensemble Spread
- Probabilities of events
- EPSgrams
- Extreme Forecast Index (EFI)
- Tropical Cyclone Strike Probability Maps

IV.4.1. Ensemble members and clusters (at ECMWF only made for Europe)

Products: Stamp maps

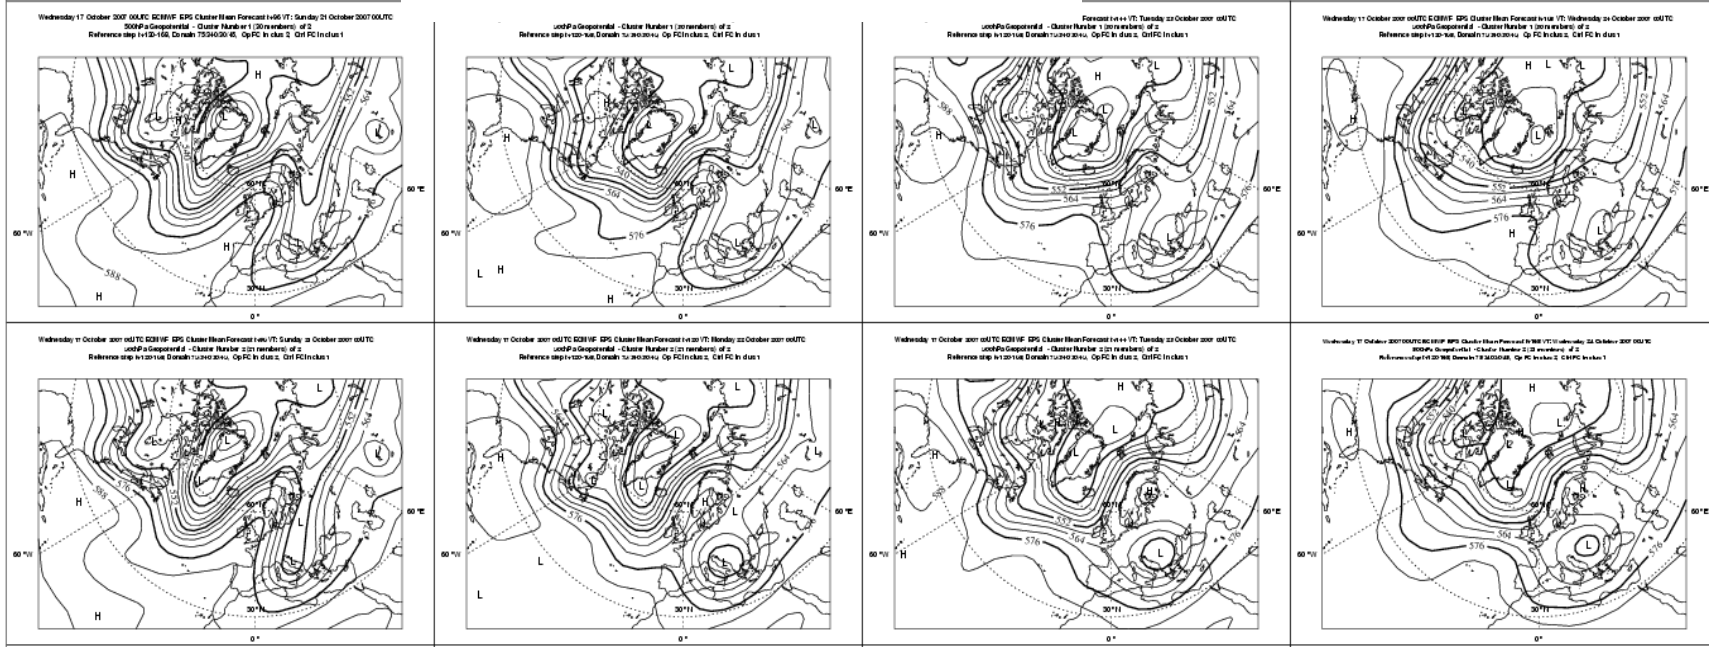

ECMWF Ensemble Forecast Clusters

Wednesday 17 October 2007 00UTC
500hPa Geopotential

Exp 0001

Cluster means 1992-2012 Now disbanded

- Cluster 1 : 30 Forecast(s)
- Cluster 2 : 21 Forecast(s)
- Cluster 3 : 0 Forecast(s)
- Cluster 4 : 0 Forecast(s)
- Cluster 5 : 0 Forecast(s)
- Cluster 6 : 0 Forecast(s)

 Distribuzione giornaliera della direzione del vento a 10 metri dal suolo (%)

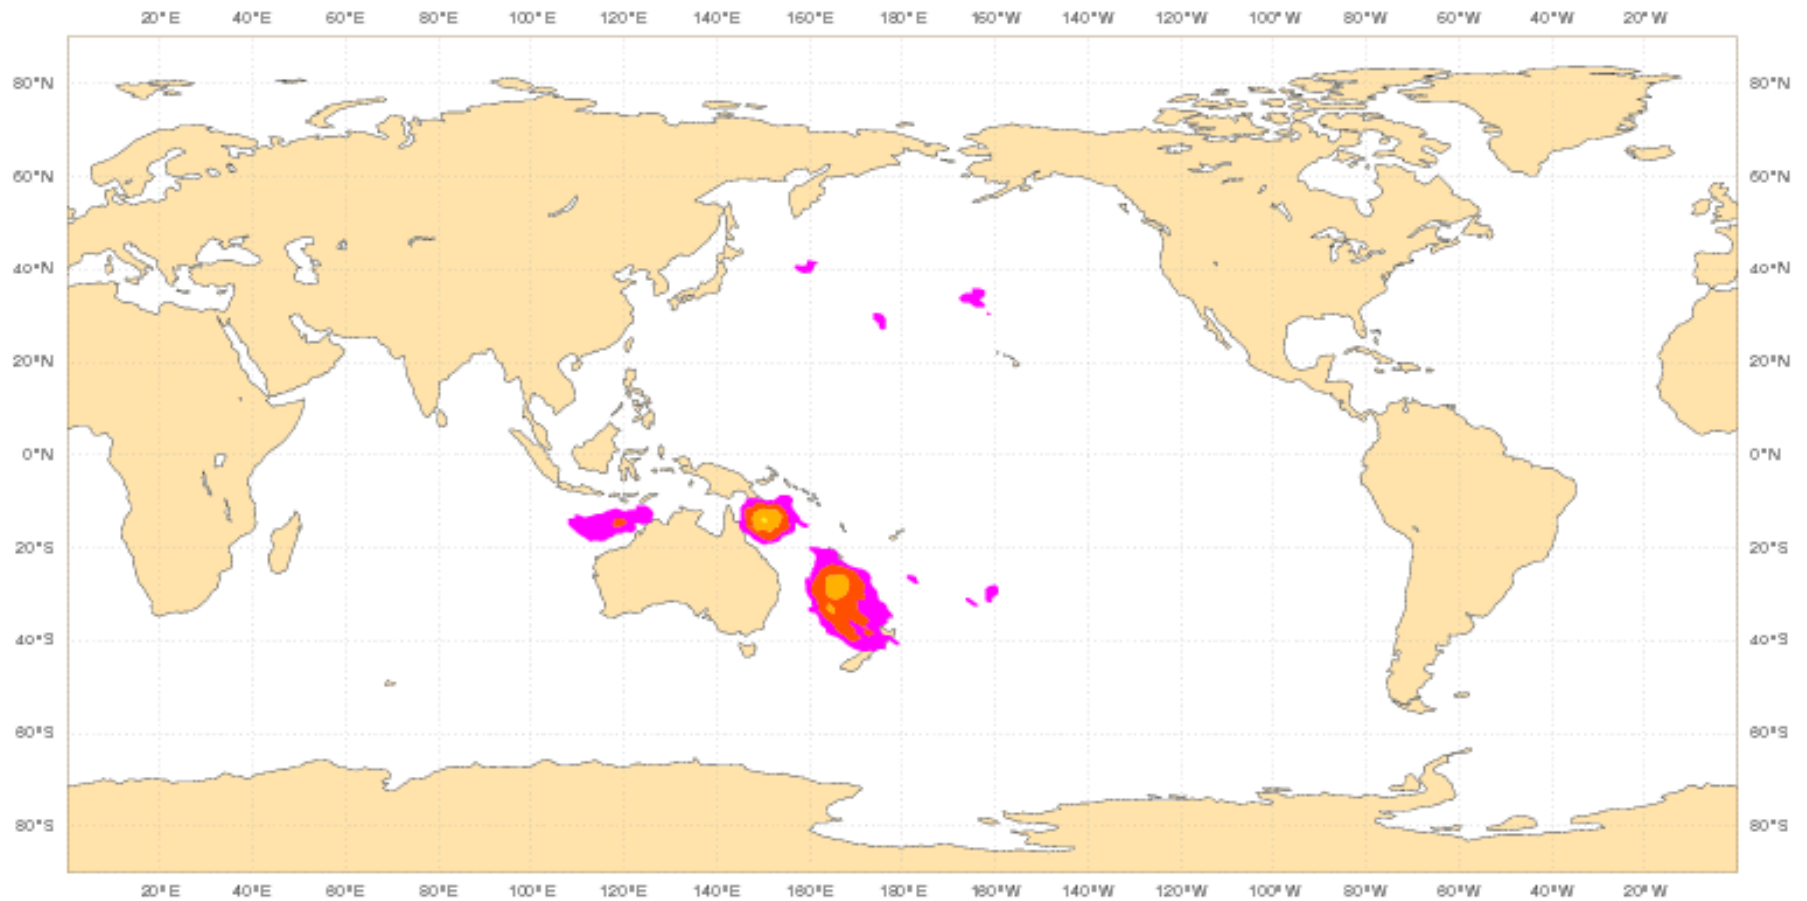

IV.4.4. Tropical cyclones

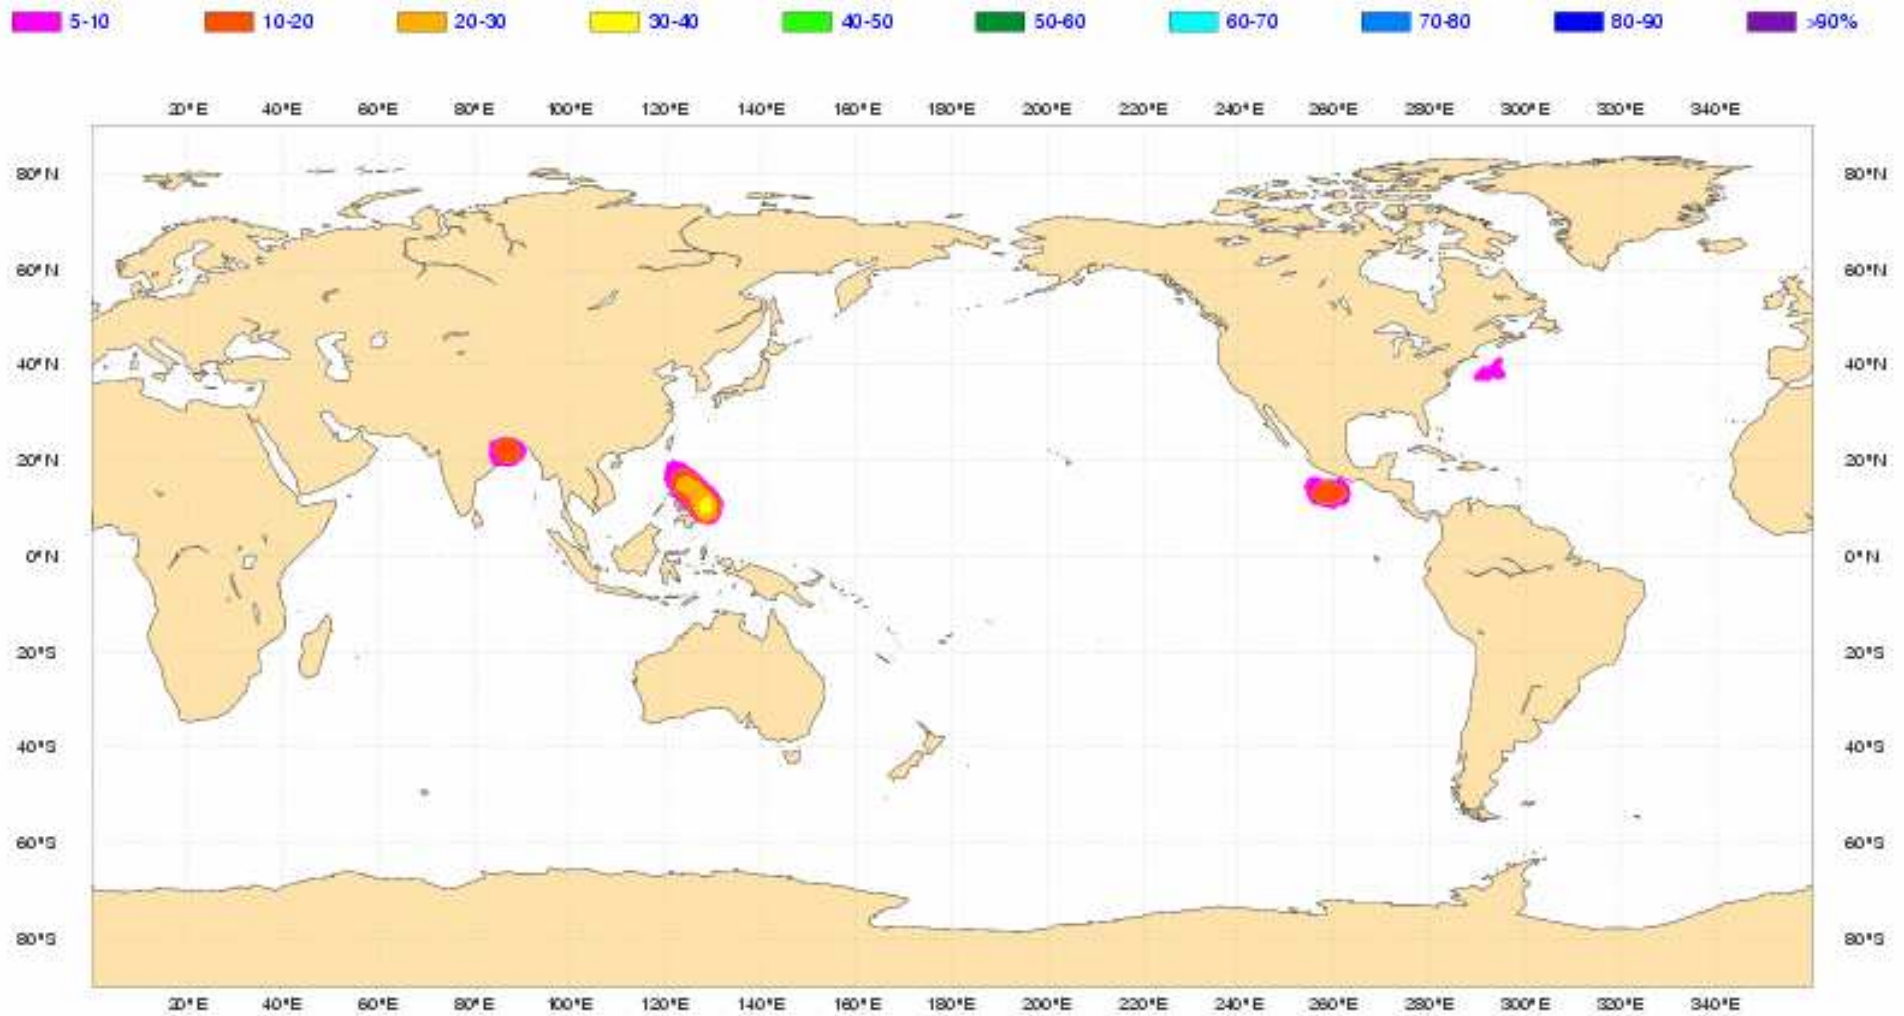

Tropical cyclones

Tropical Cyclone Strike Probability Start date:Friday 08 March 2013 at 00 UTC
valid for 48hours from Friday 15 March 2013 at 00 UTC to Sunday 17 March 2013 at 00 UTC
Probability of a Tropical Cyclone passing within 300km radius

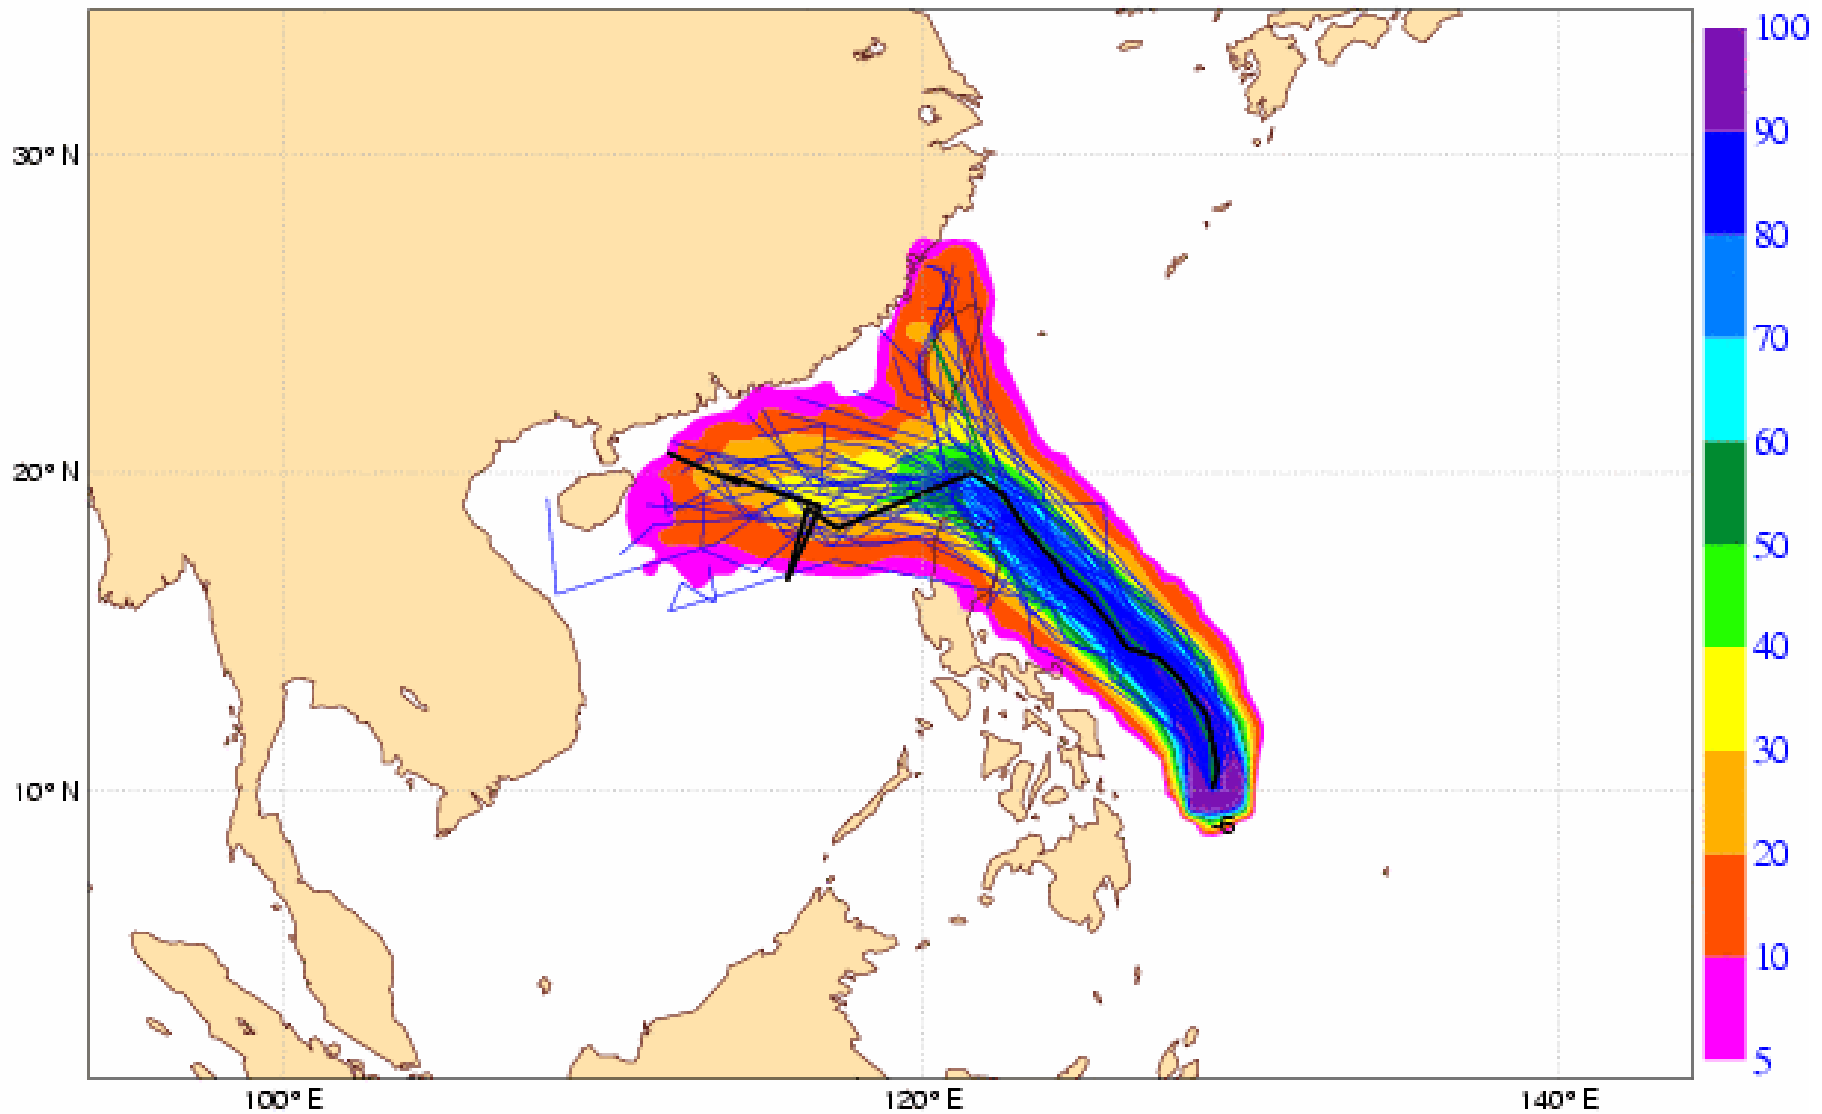

**Tropical Storm Strike Probability Start date Thursday 16 June 2011 at 00 UTC
valid for 48hours from Friday 17 June 2011 at 00 UTC to Sunday 19 June 2011 at 00 UTC
Probability of a Tropical Storm passing within 300km radius**

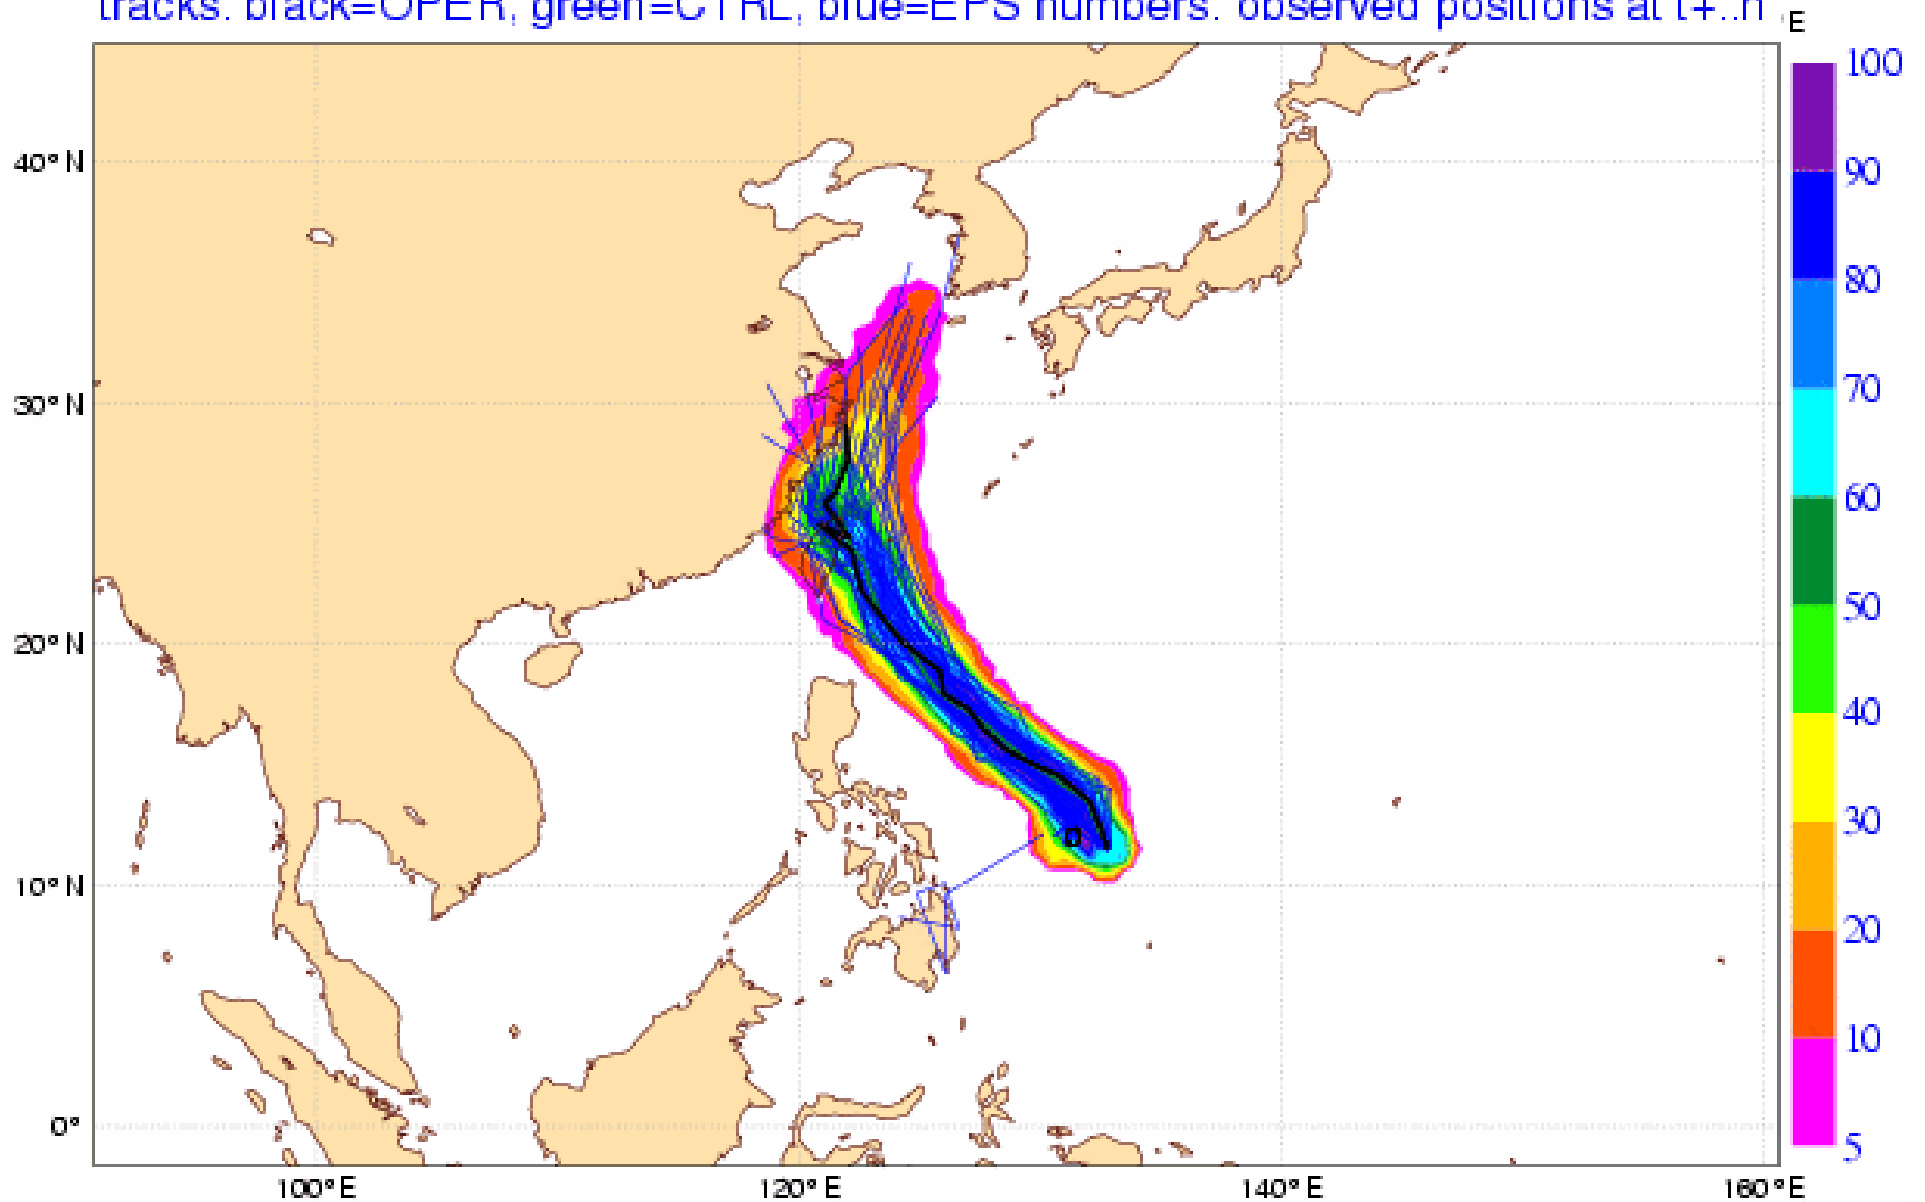

20110617 0 UTC

Probability that 06W will pass within 120km radius during the next 120 hours
tracks: black=OPER, green=CTRL, blue=EPS numbers: observed positions at t+..h

20110621 12 UTC

Probability that 07W will pass within 120km radius during the next 120 hours
tracks: black=OPER, green=CTRL, blue=EPS numbers: observed positions at t+.h

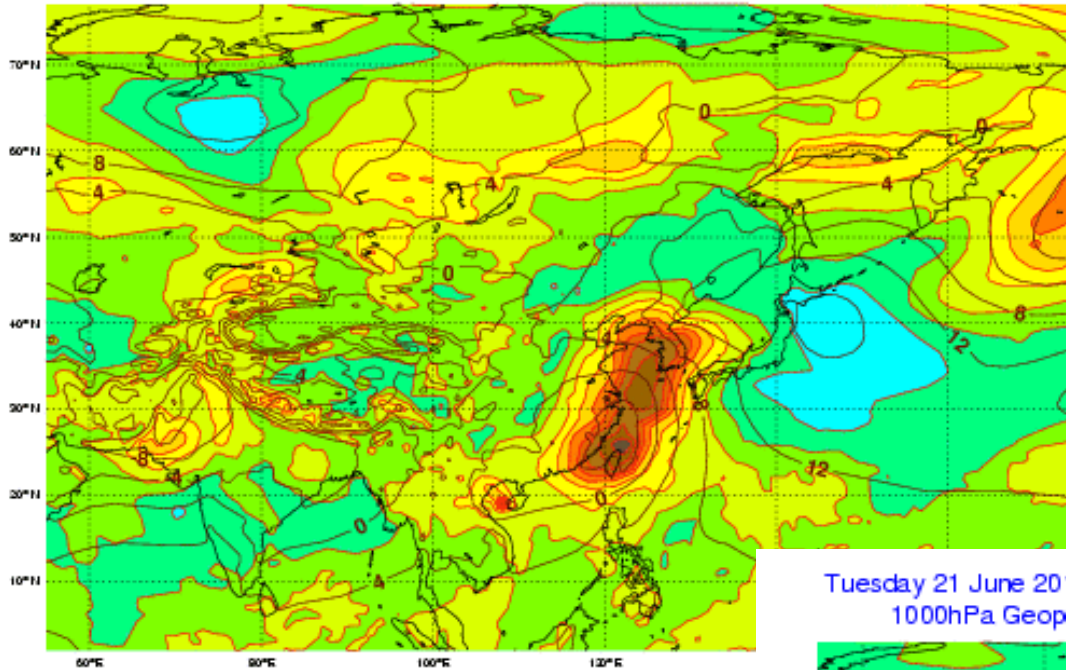

Bologna 9-13 February 2015

EPS Lagrangian Meteogram
Tropical Cyclone 07W (07W) starting from 12 N 131.4 E

IV.4.5. Working with the EPS

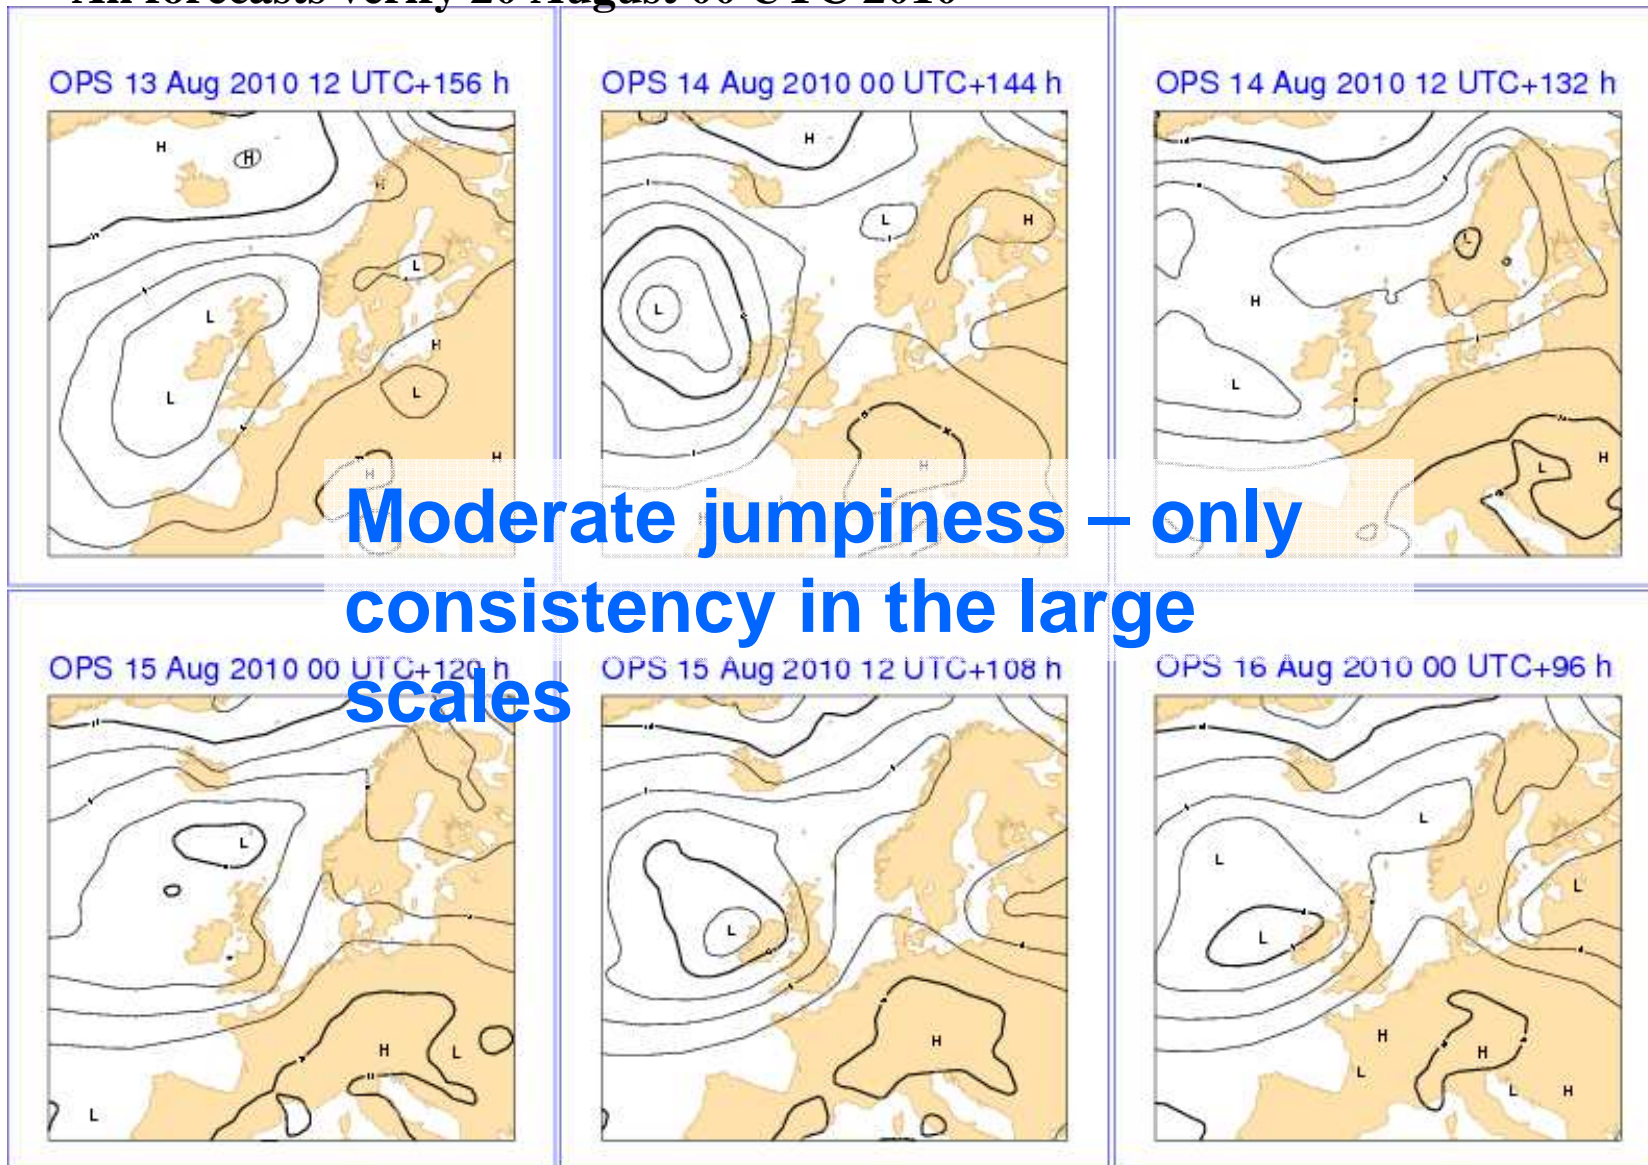

- Ensemble mean acts as a dynamic filter and removes normally unpredictable features**
- The removed features are put back in a consistent way as probabilities**

Which temperature for day 7?

The relation between synoptic scale and predictability

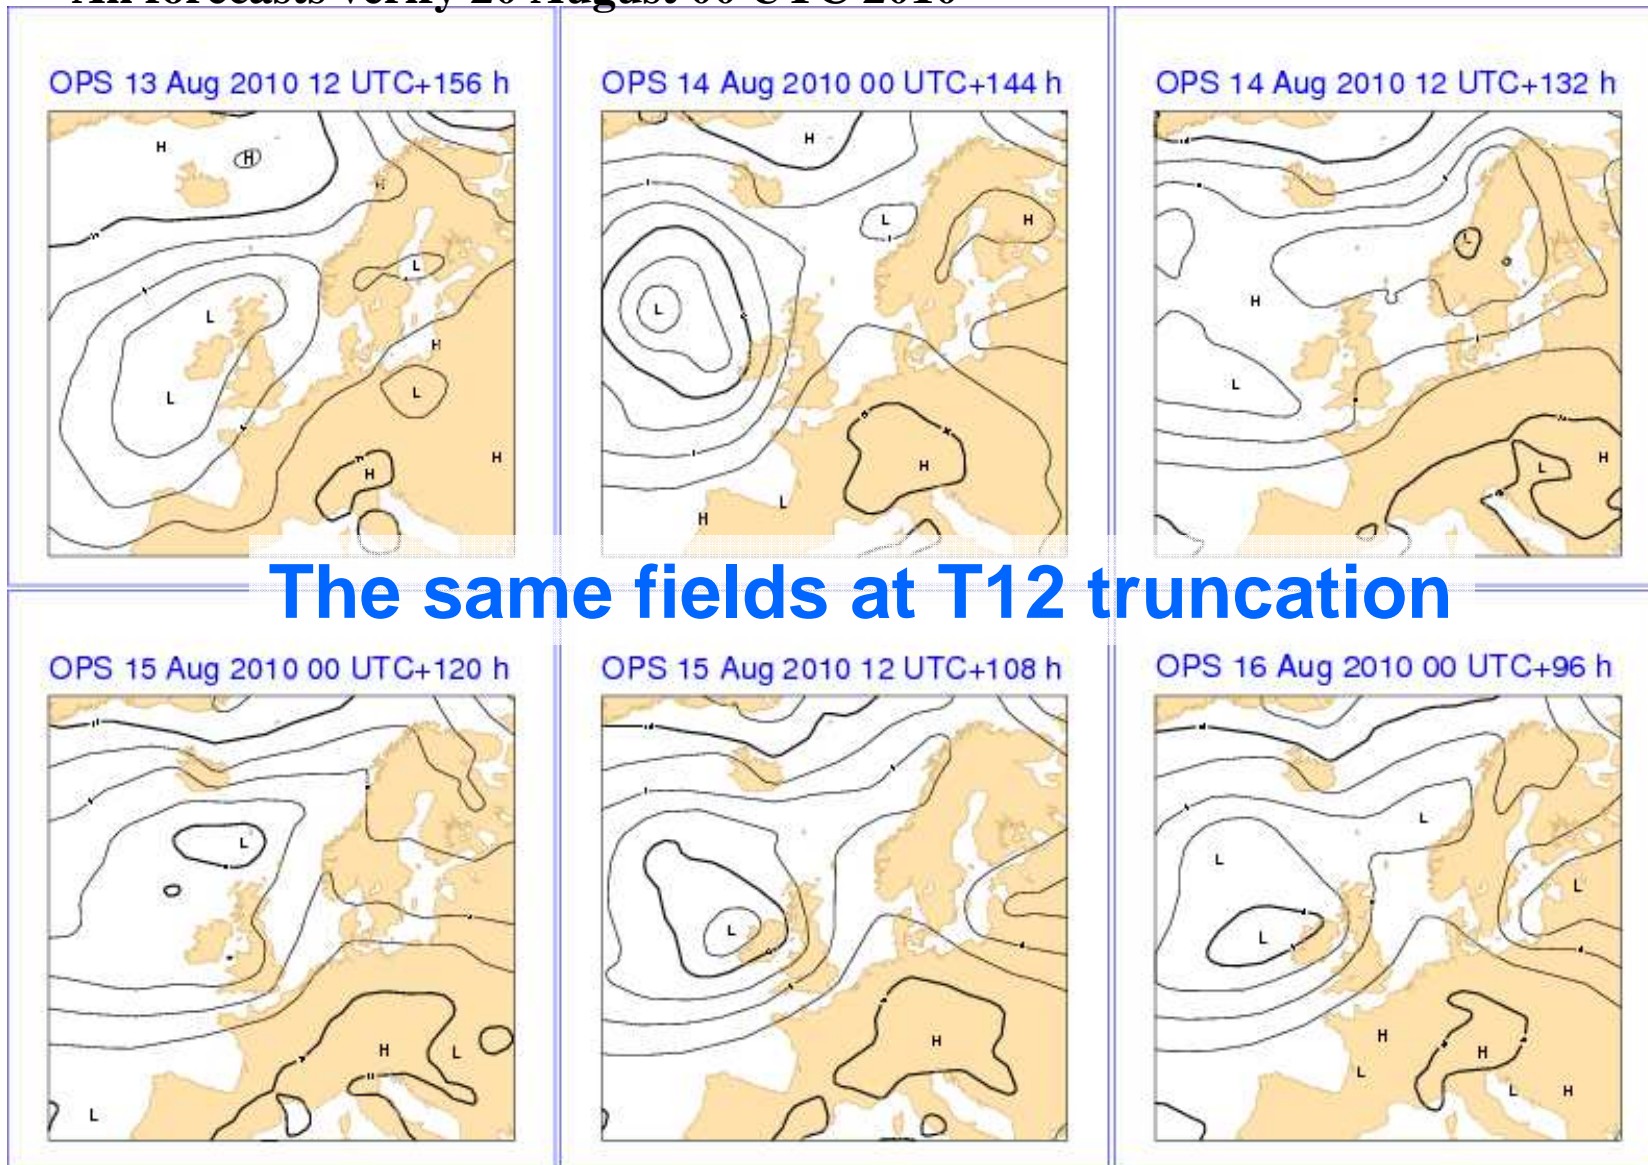

All forecasts verify 20 August 00 UTC 2010

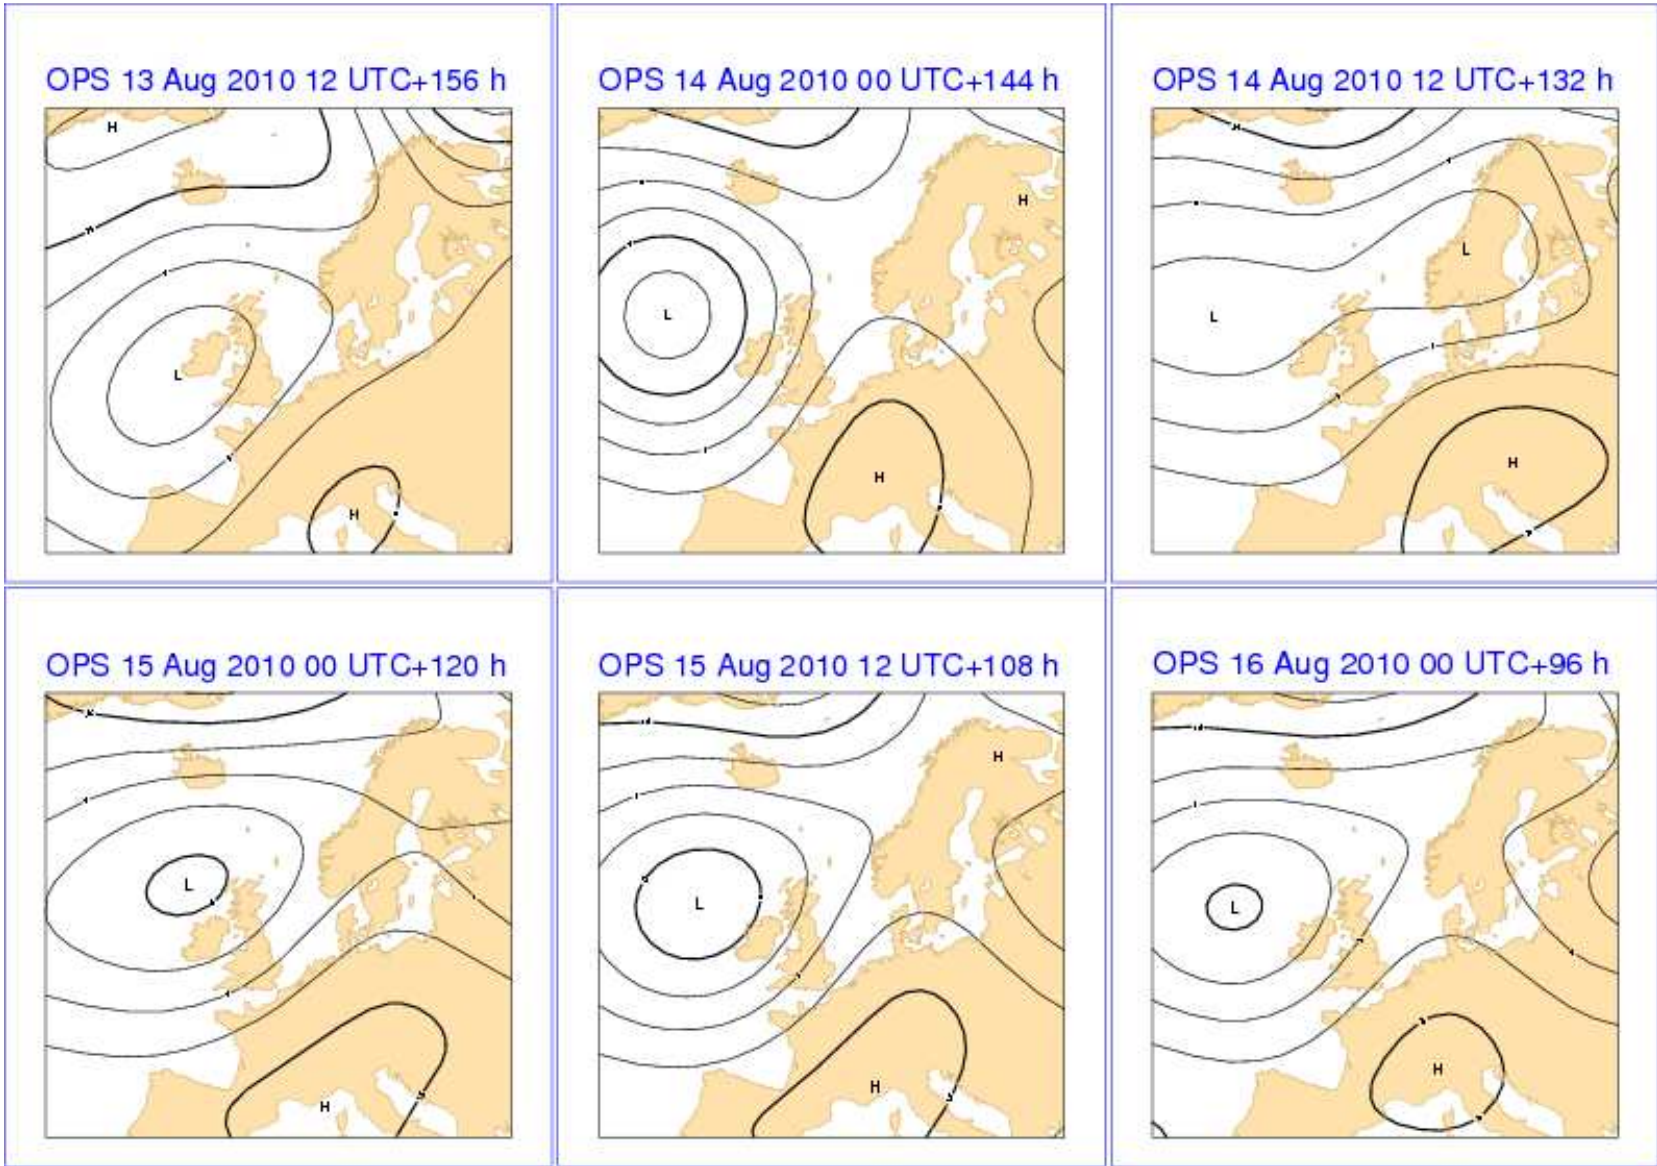

Moderate jumpiness – only consistency in the large scales

The relation between synoptic scale and predictability

All forecasts verify 20 August 00 UTC 2010

The same fields at T12 truncation

EPS 13 Aug 2010 12 UTC+156 h

EPS 14 Aug 2010 00 UTC+144 h

EPS 14 Aug 2010 12 UTC+132 h

The smooth EM defines the general flow pattern and the probabilities represents what is “lost” in the averaging

EPS 15 Aug 2010 00 UTC+120 h

EPS 15 Aug 2010 12 UTC+108 h

EPS 16 Aug 2010 00 UTC+96 h

The effect of filtering on error and jumpiness

Comparison between single +120 h fcsts and ones lagged with previous two days'

The *perceived* problems with the ensemble mean (EM):

“-EM does not display realistic flow patterns”

Only a problems for meteorological experts

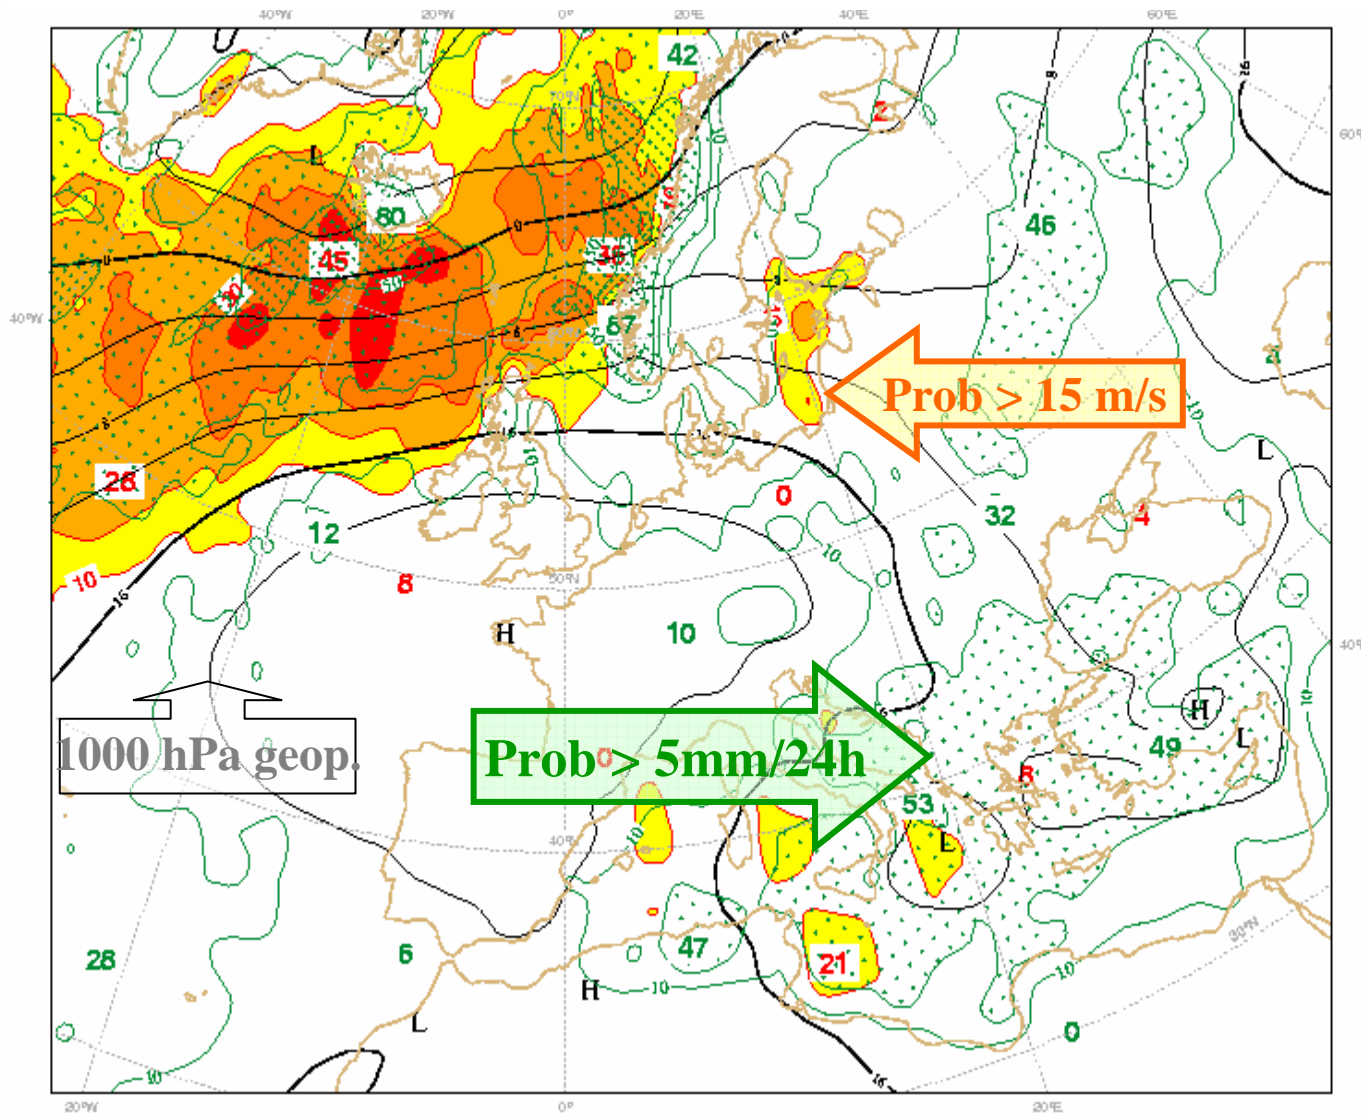

“-EM cannot forecast extremes”

That ‘s why probabilities are needed to complement the EM

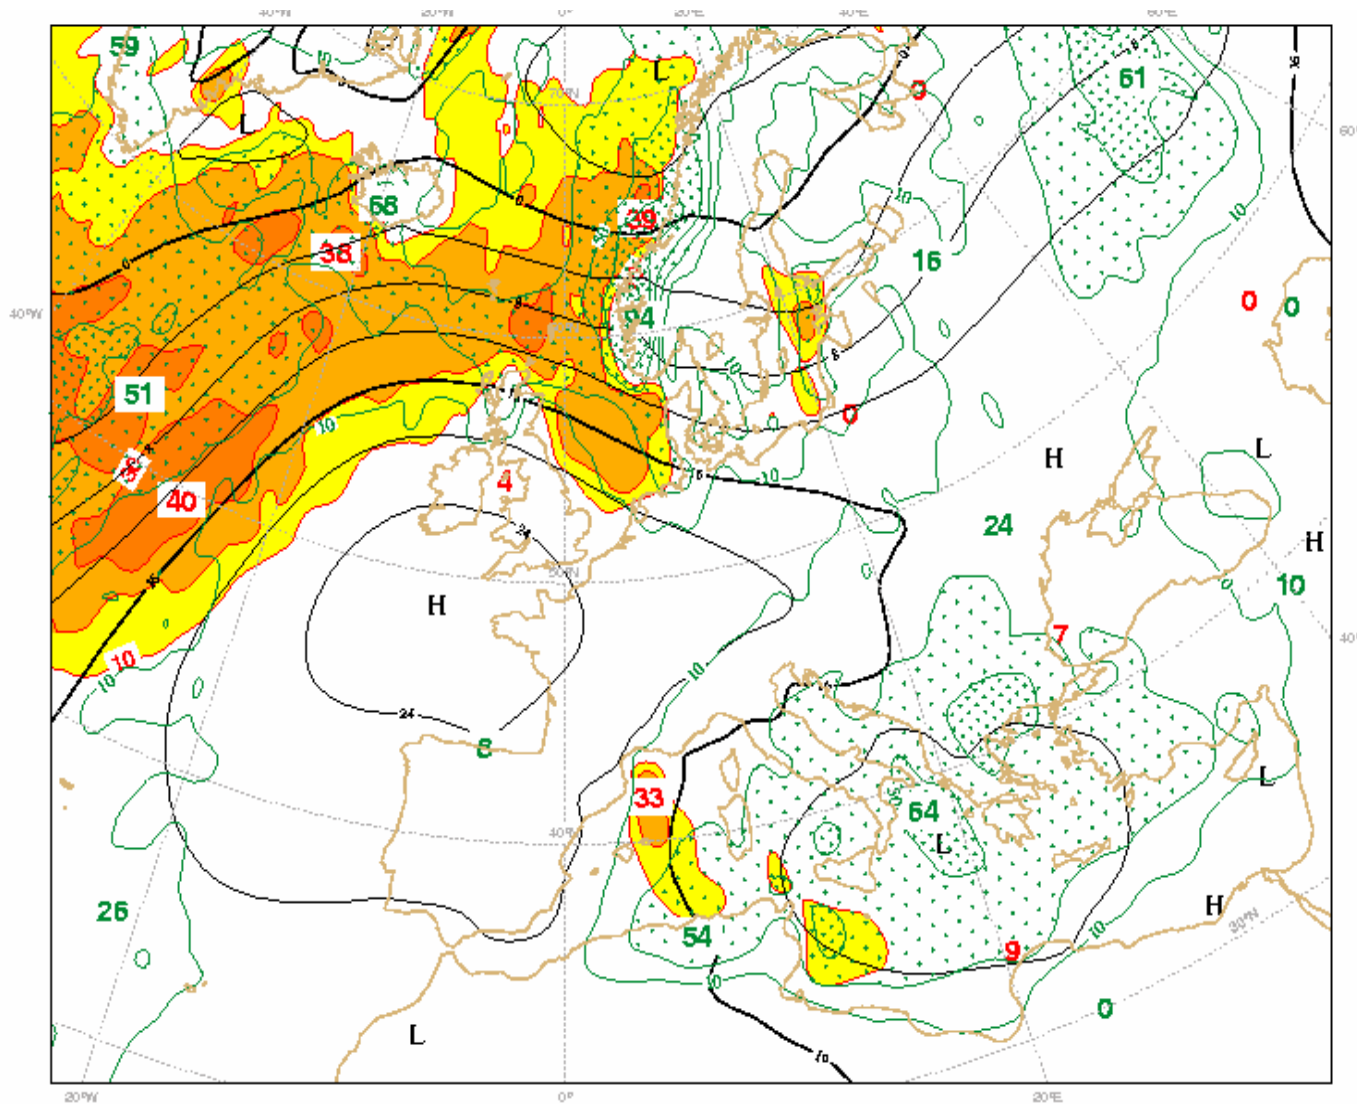

“-EM might provide internally inconsistent weather parameters”

So does some of the output from the deterministic system

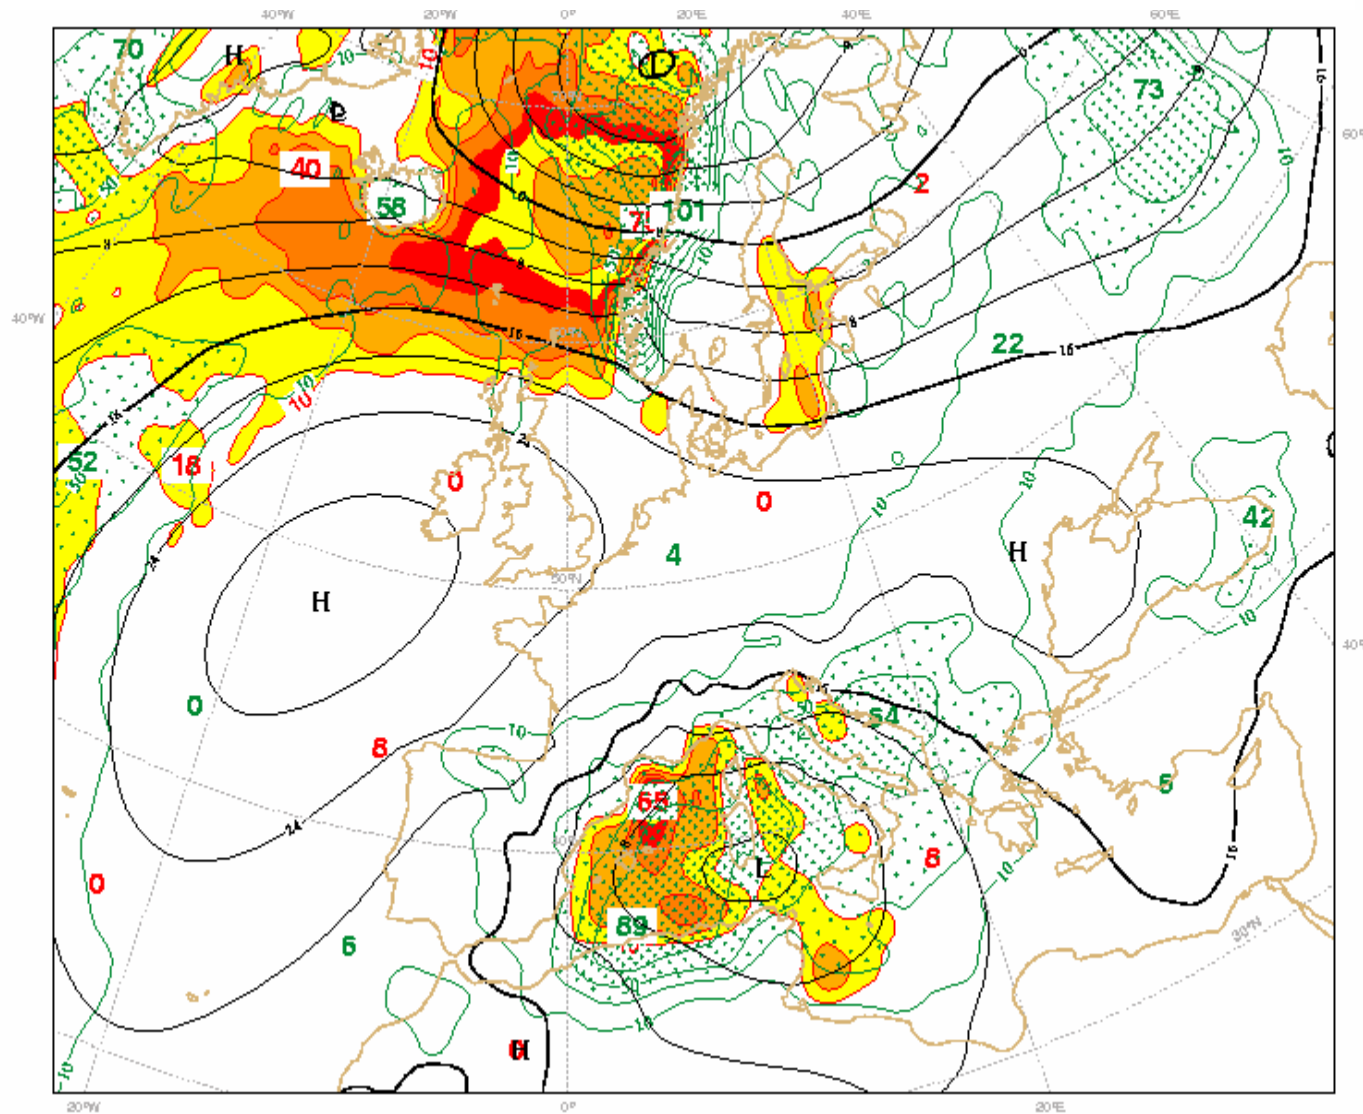

EPS forecast 4 Nov 2001 D+7 verifying 11 November

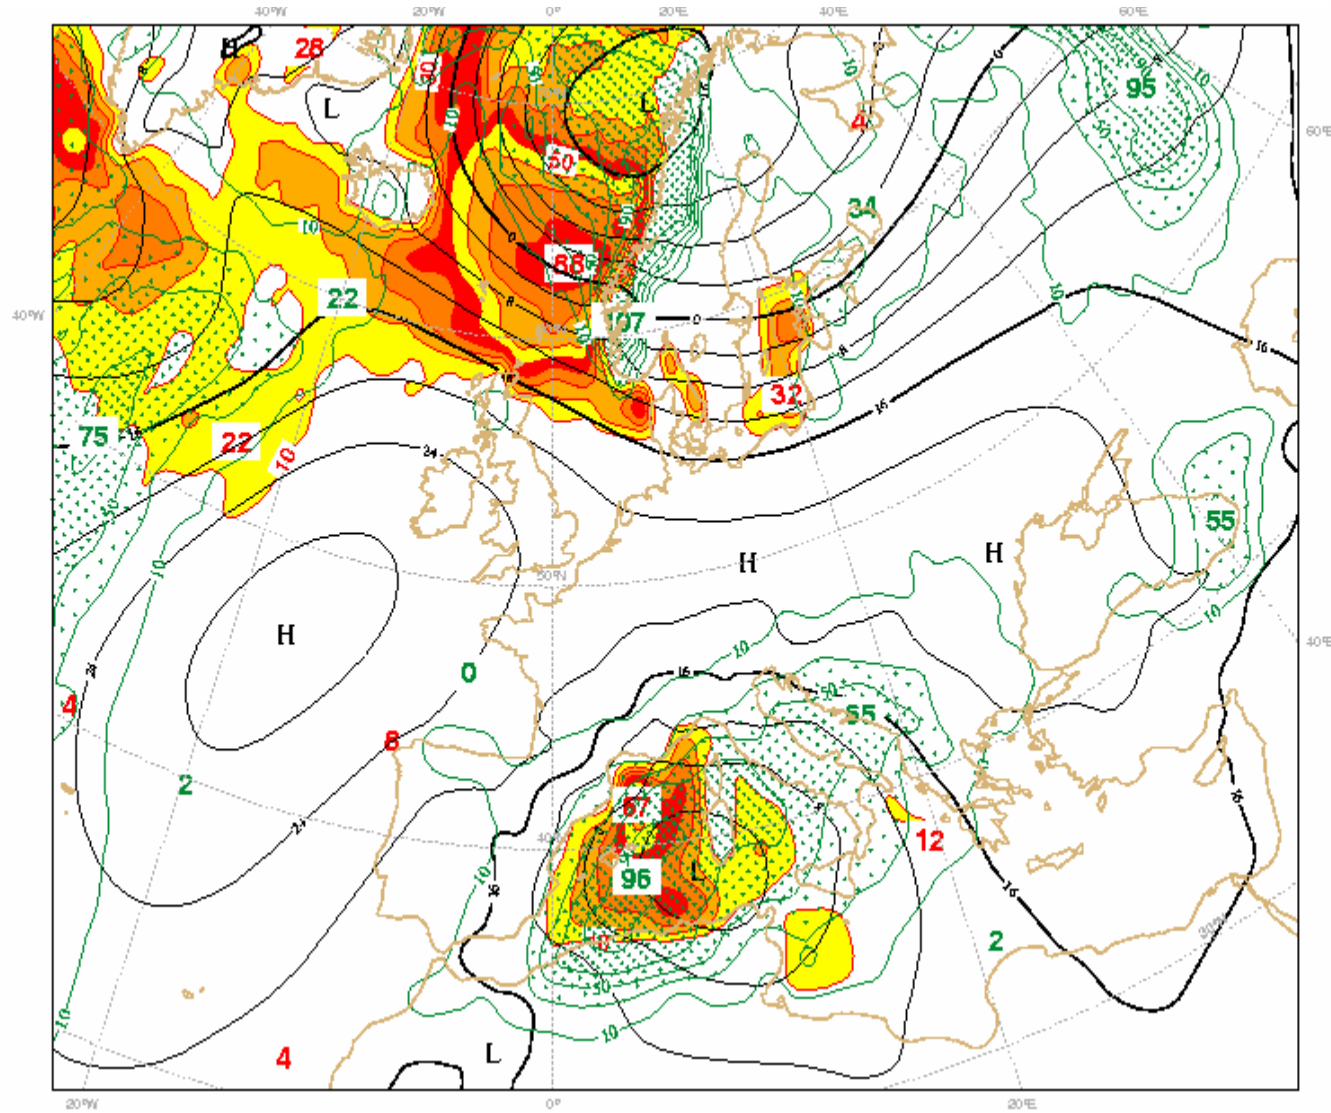

EPS forecast 5 Nov 2001 D+6 verifying 11 November

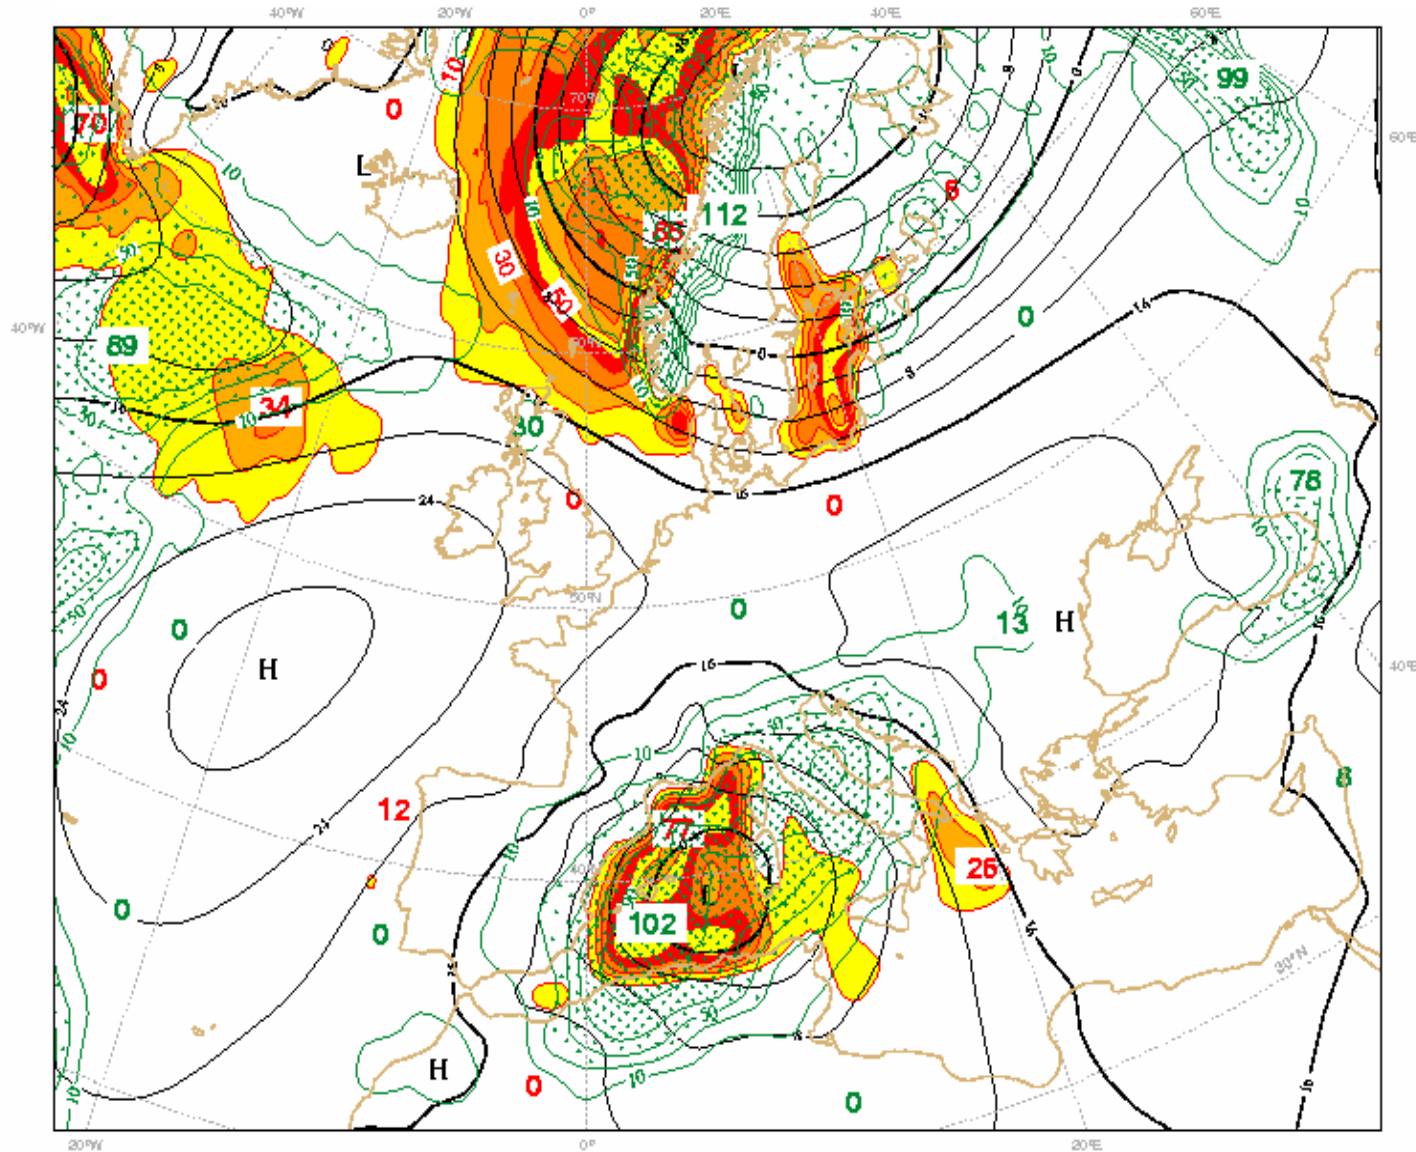

EPS forecast 6 Nov 2001 D+5 verifying 11 November

EPS forecast 7 Nov 2001 D+4 verifying 11 November

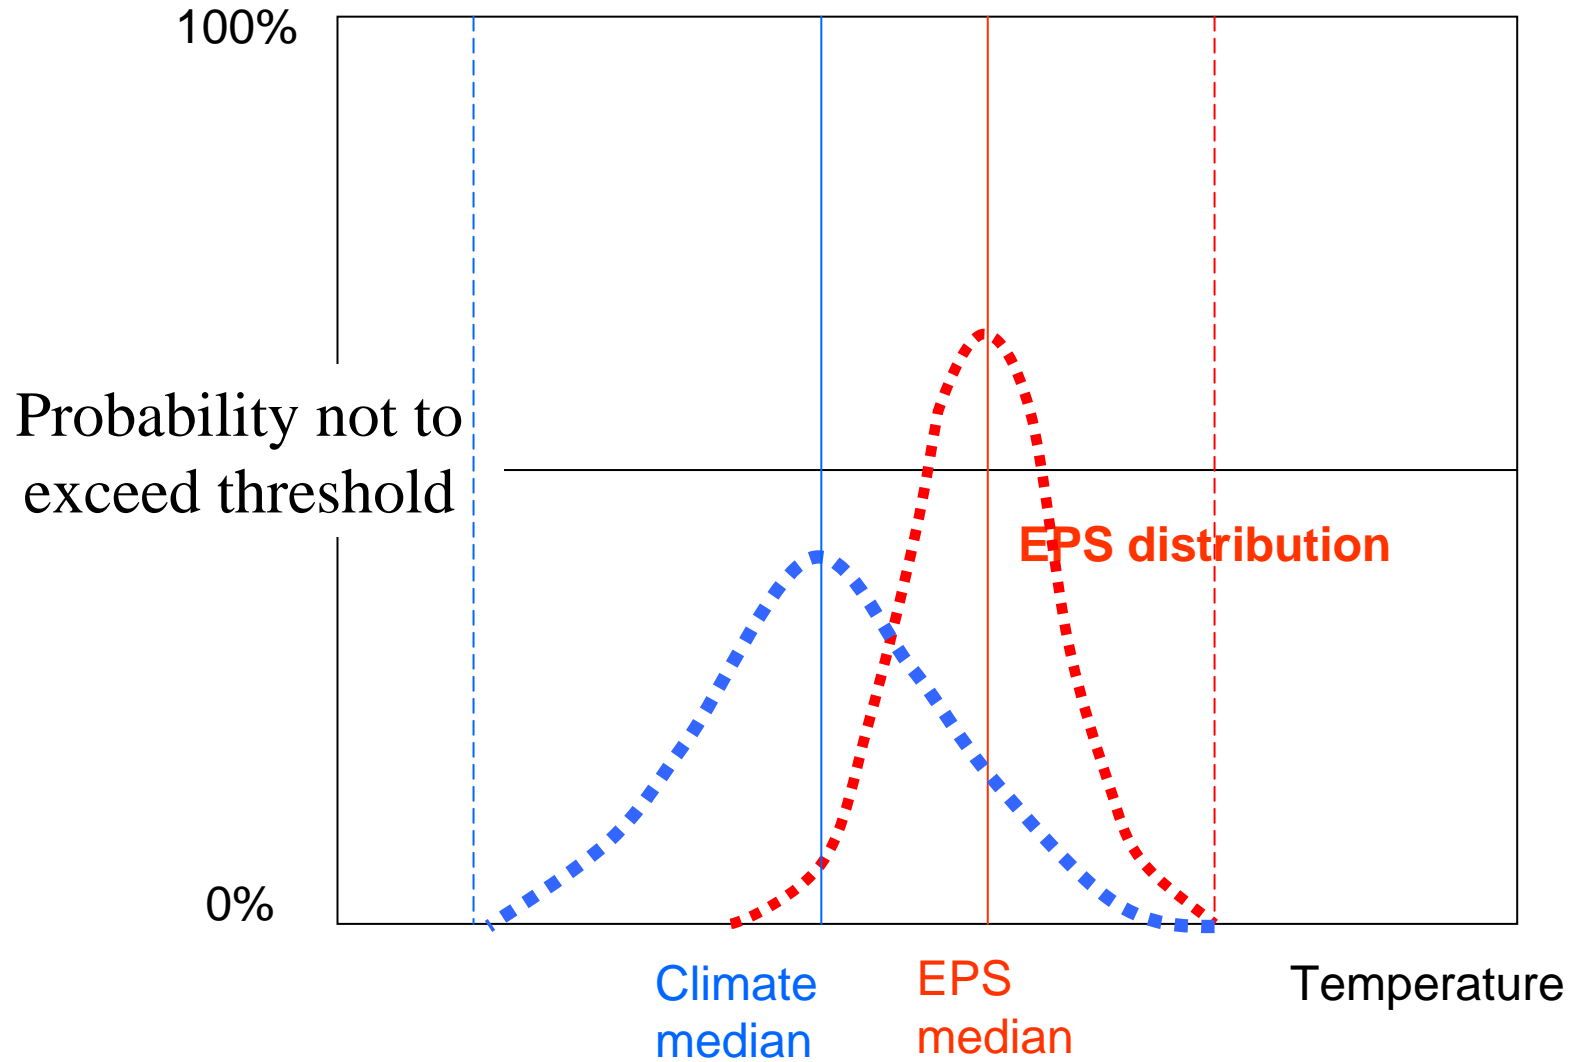

EPS forecast 8 Nov 2001 D+3 verifying 11 November

IV.4.6 The Extreme Forecast Index

Probability density functions (PDF)

Means and asymmetric variances are easily spotted

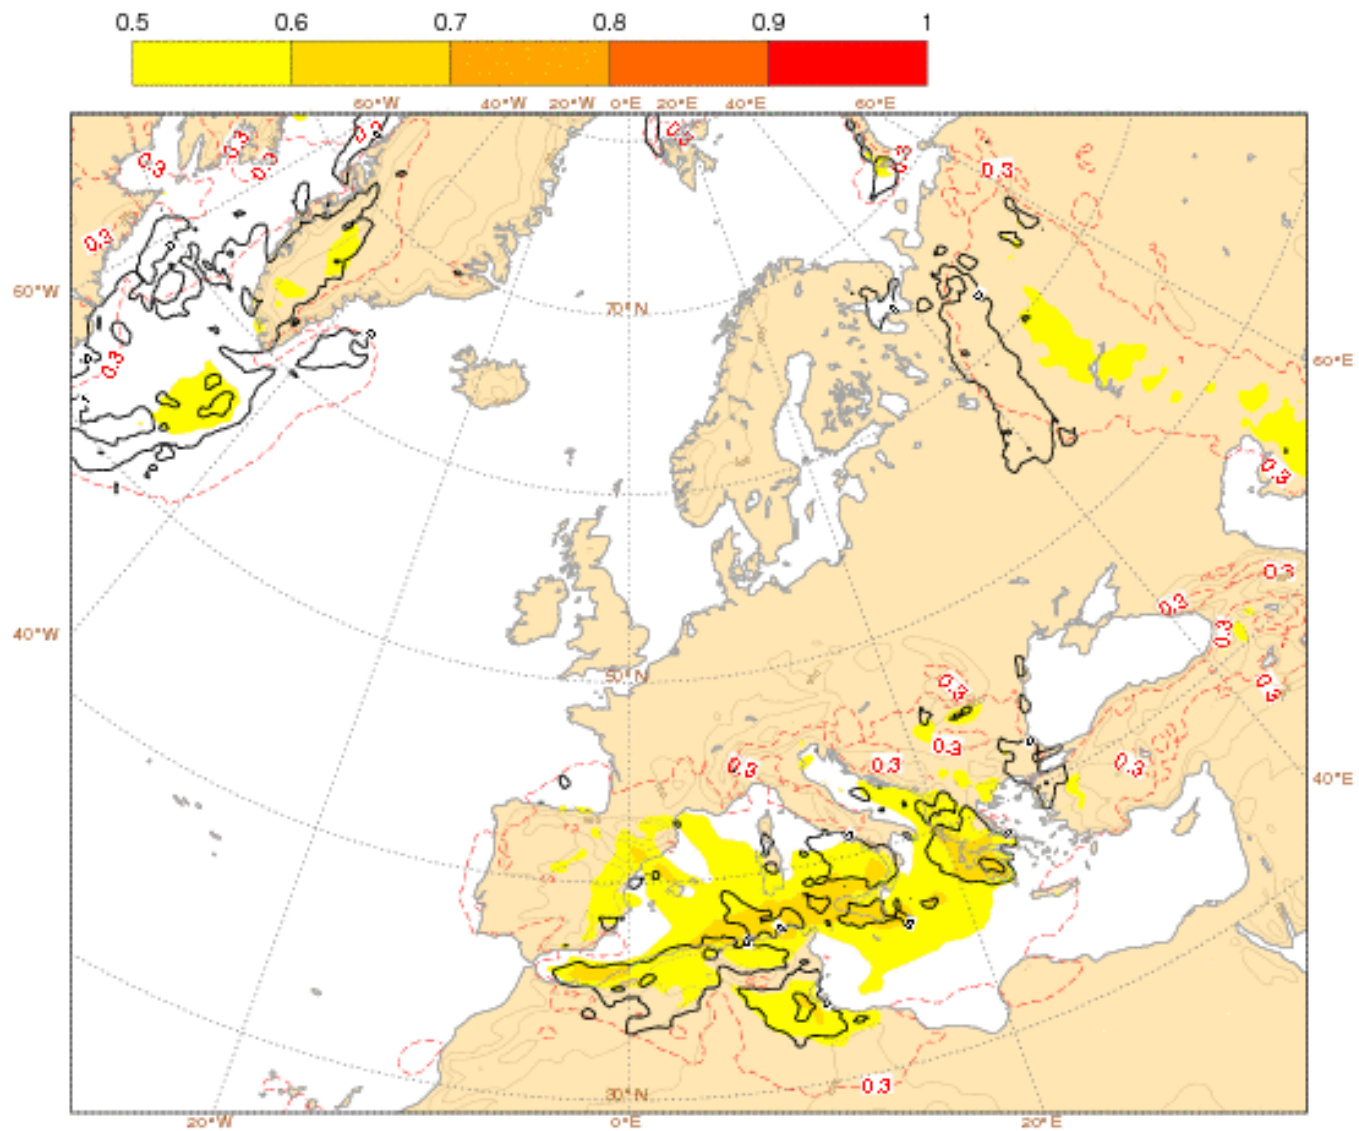

Probability density functions (PDF)

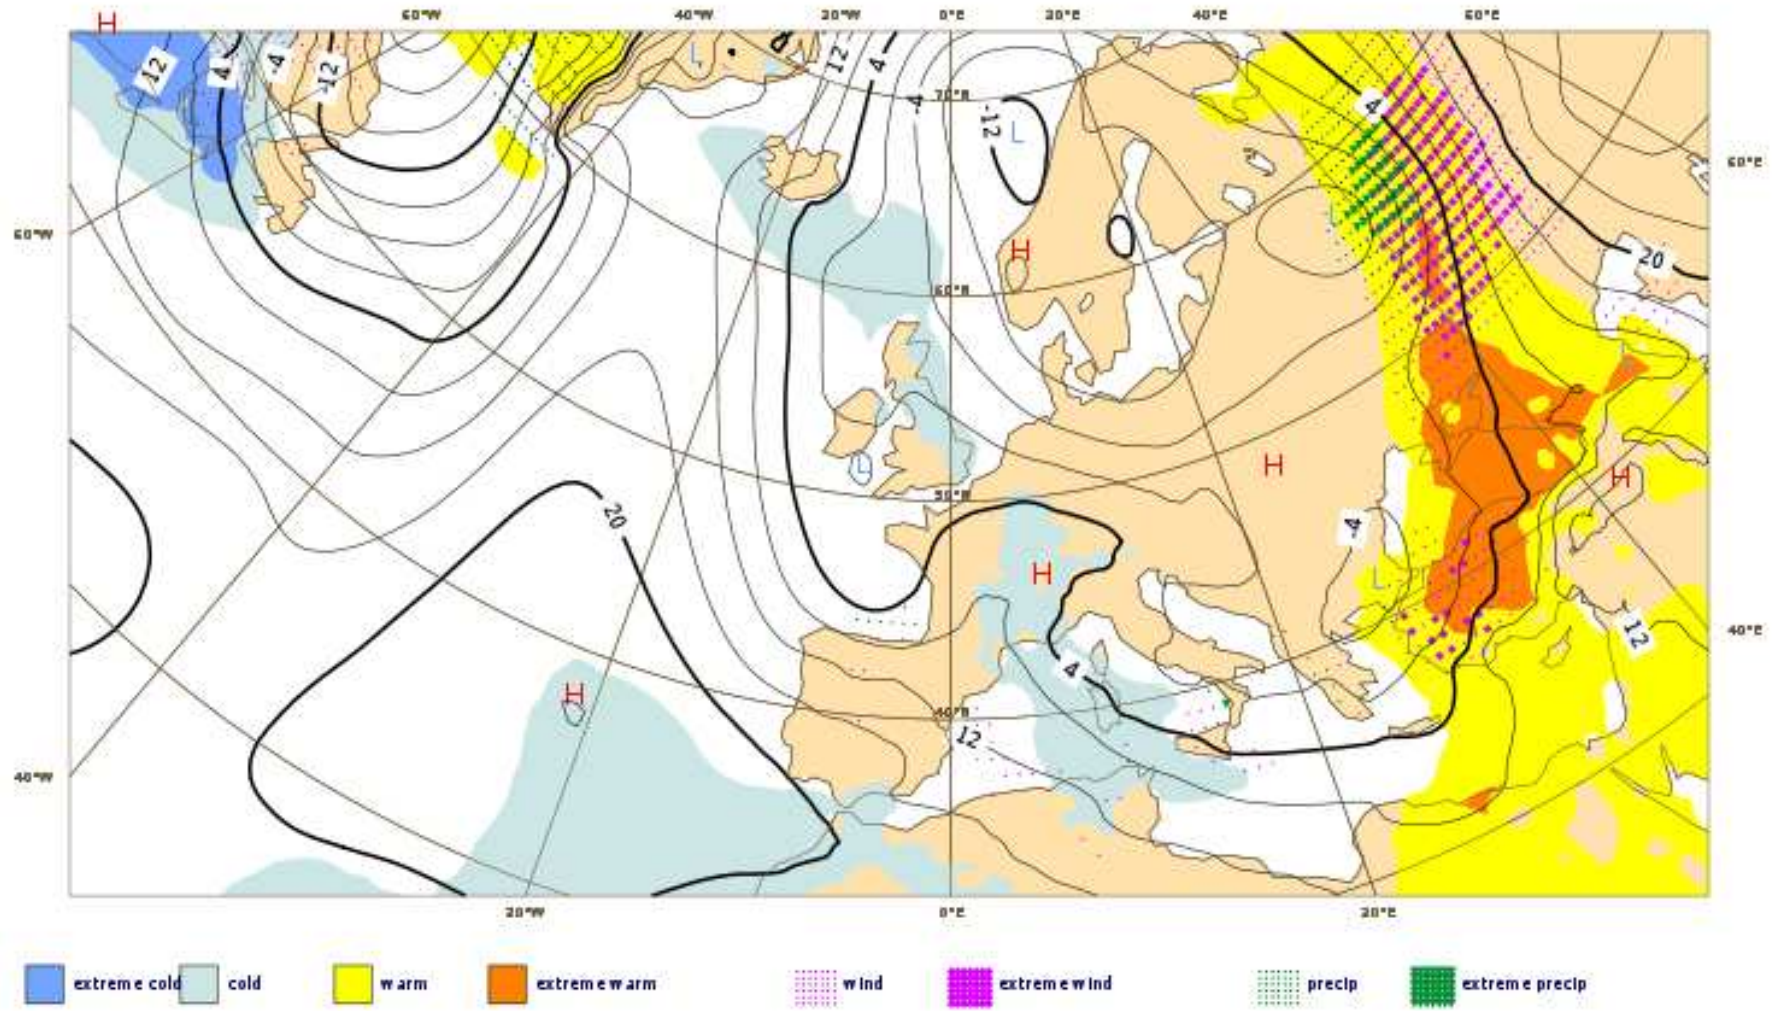

Means and asymmetric variances are easily spotted

Thu 29 Jan 2015 00UTC ©ECMWF t+144-168h VT: Wed 04 Feb 2015 00UTC - Thu 05 Feb 2015 00UTC
Extreme forecast index and Shift of Tails (black contours 0,1,5,10,15) for 10m wind gusts

Anomalous weather predicted by EPS: Thursday 29 January 2015 at 00 UTC
 1000 hPa Z ensemble mean (Monday 02 February 2015 at 12 UTC)
 and EFI values for Total precipitation, maximum 10m wind gust and mean 2m temperature (all 24h)
 valid for 24hours from Monday 02 February 2015 at 00 UTC to Tuesday 03 February 2015 at 00 UTC

“Clickable” epsgrams provide model climate

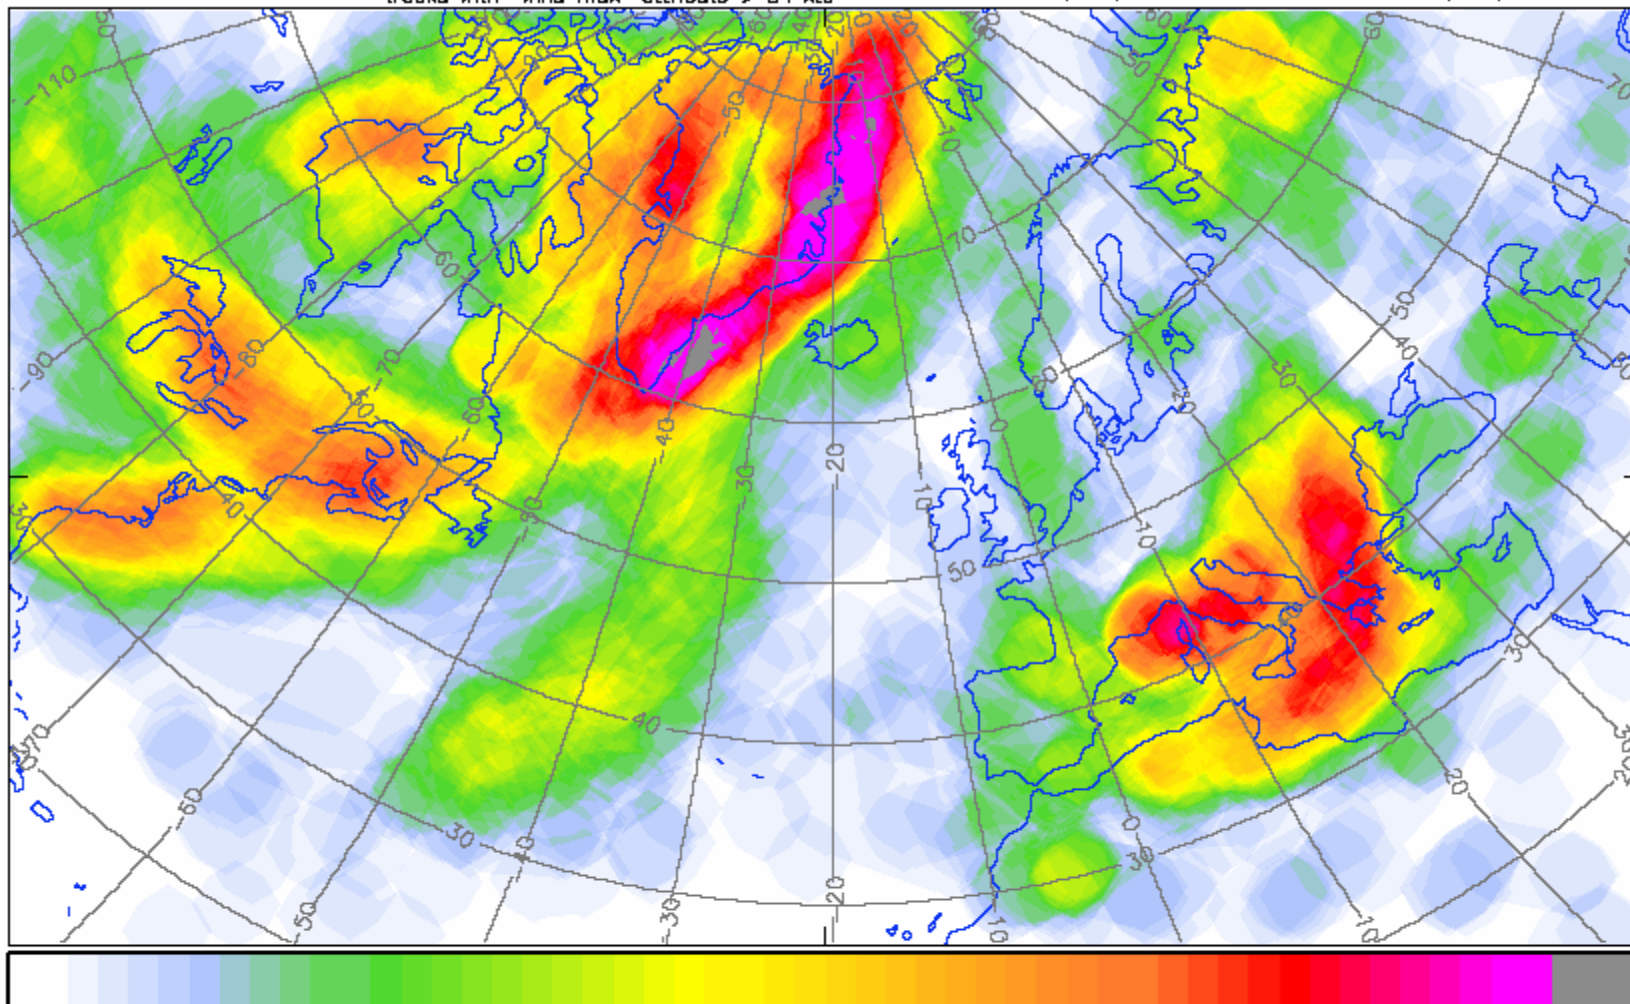

IV.4.7 Extra-tropical storm site (Tim Hewson)

156 (+/-12h window)

Feature Point Strike Probability, for feature tracks with "wind max" attribute > 34 kts

DT: Thu 29/01/2015 12Z

VT: Thu 05/02/2015 00Z

Maps show percentage of members predicting that a cyclonic feature point will track within 300km in a 24-hour period. Only cyclonic features reaching a certain intensity threshold at some point in the 24h period are included. Here the threshold is that the max 1km wind speed within 300km must exceed 34kts.
