

A decade of HEPEX: ECMWF progress and the rise of ensembles

Roberto Buizza

European Centre for Medium-range Weather Forecasts

Ensembles: why?

To predict the time evolution of the probability density function of forecast states.

In other words, to predict the most likely scenario and its uncertainty, expressed e.g. in terms of probabilities of weather events, to estimate the forecast confidence, ..

2004: ensembles were used only in forecast mode

System components simulate the effect of:

- Initial uncertainties
- Model uncertainties (1 stochastic scheme)

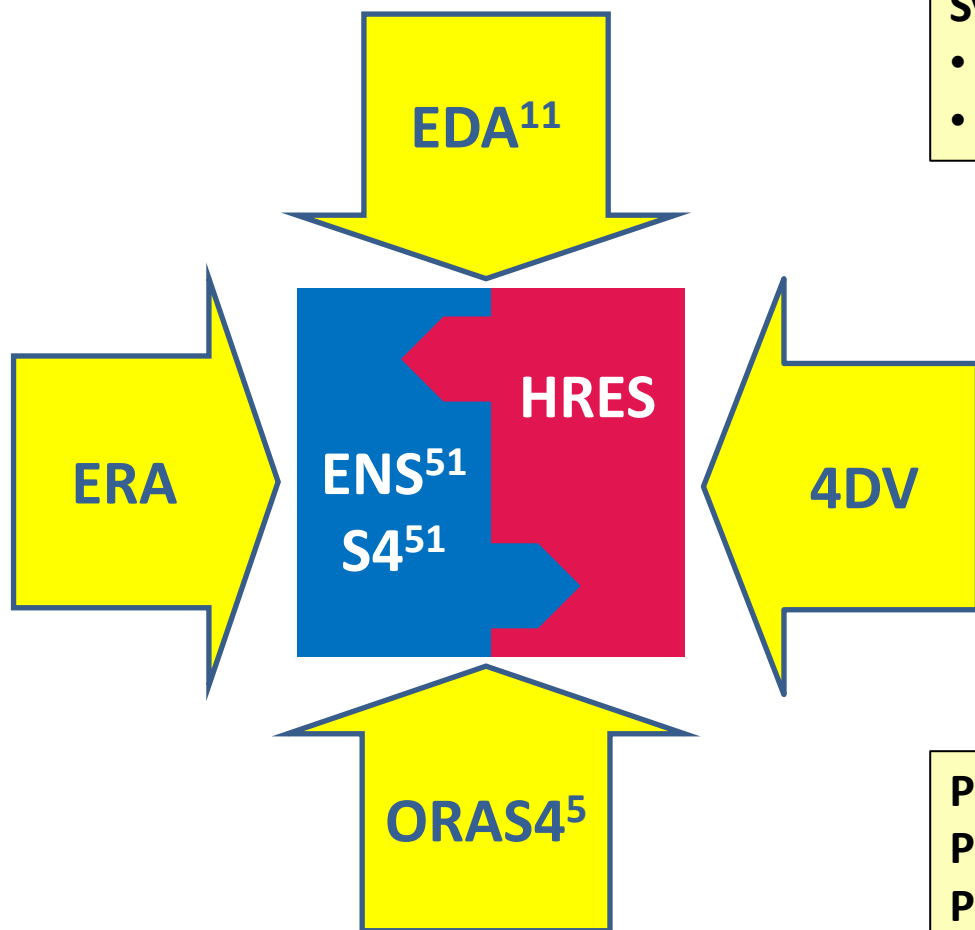

PDF(0) << N/A

PDF(0) << N/A

PDF(T) << HRES+ENS⁵¹/S2³¹

2014: ensembles are used in analysis and forecast modes

System components simulate the effect of:

- Observation uncertainties
- Model uncertainties (2 stochastic schemes)

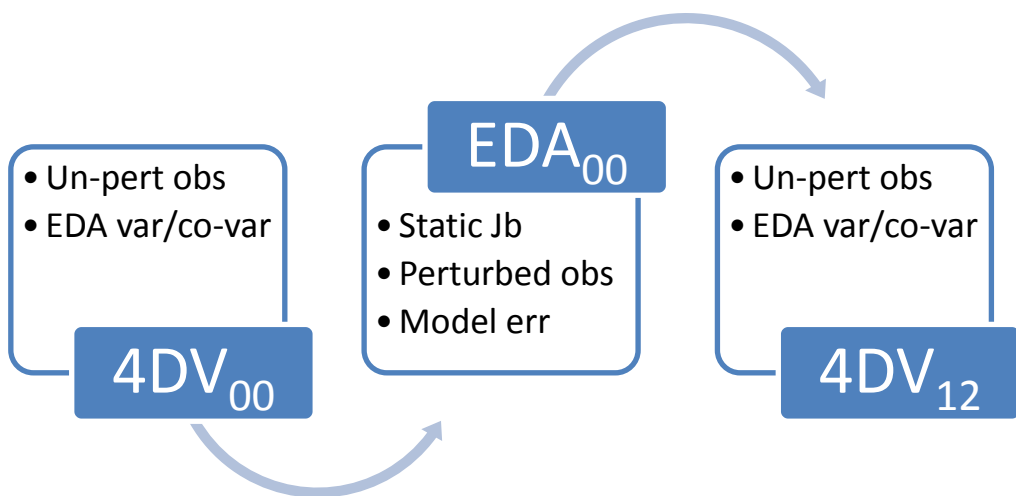

$PDF(0) \ll 4DV + EDA^{11} + ORAS4^5$
 $PDF(0) \ll ERA + ORAS4^5$ (the past)
 $PDF(T) \ll HRES + ENS^{51} / S4^{51}$

Ensembles are now used to estimate flow dependent stats

Nov 2013: the **EDA size has increased from 10 to 25 members**, to provide 4DV-HRES also with flow dependent background error co-variances. EDA-based perturbations from the past 12 days will be used (sample size=600).

Background error correlation length scale for $\text{long}(p_{\text{msl}})$ and p_{msl}

Flow dependent est. are key to properly assimilate obs

With the new calculation of background error covariances, the correlation length scales now vary significantly in time.

This figure shows the differences between temperature correlations at ~ 28 hPa for two points (45N/OE and 45S/OE) for a day in January and June from cycle 40r1 EDA.

It is clear that the SH winter (red solid) and summer (red dashed) temperature correlations are significantly different, a feature that cannot be accurately presented by climatological correlations.

How does ENS perform in terms of reliability?

Reliability is a key property that probabilistic forecasts must have.

How does ENS perform in terms of prob(TP)?

*How can we
Extend it?*

ENS now runs to 32d and is coupled to an ocean from d0

Nov 2013: **coupling from initial-time** to a new version of the ocean model (NEMO), with 1-way wave-currents coupling, has improved skill, especially in the monthly time-range.

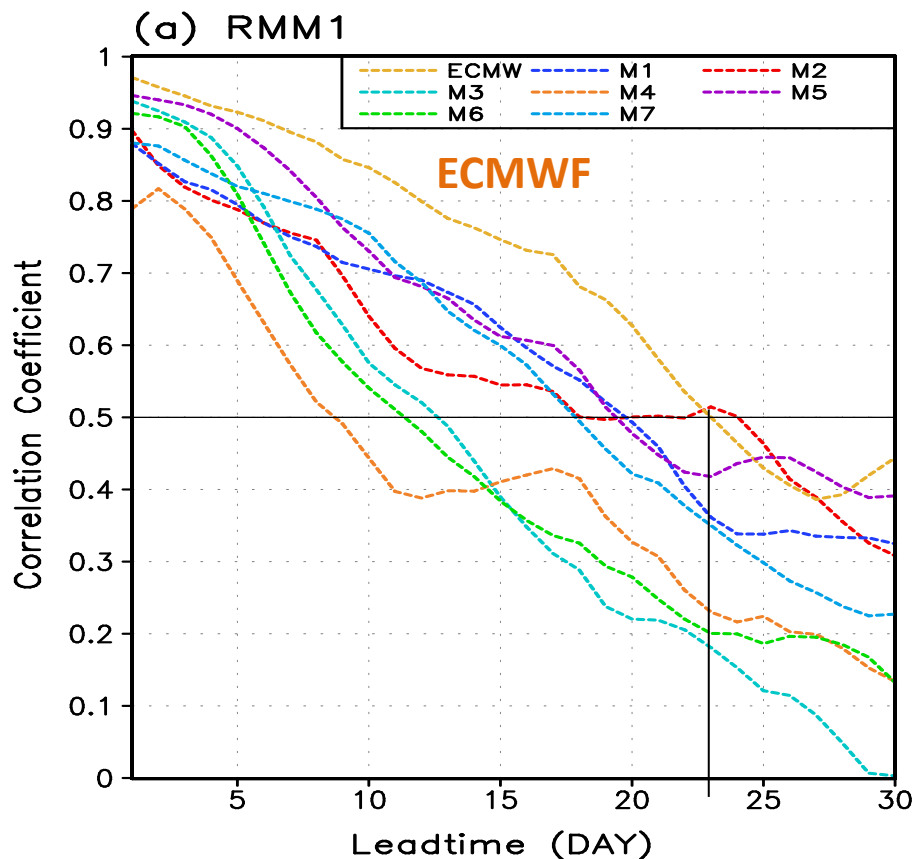

Work is progressing to introduce a better, unified wave-currents-sea-ice model (LIM). The new model based on NEMO is under testing at higher resolution, ORCA_025_Z75. It will be implemented in H2-2015.

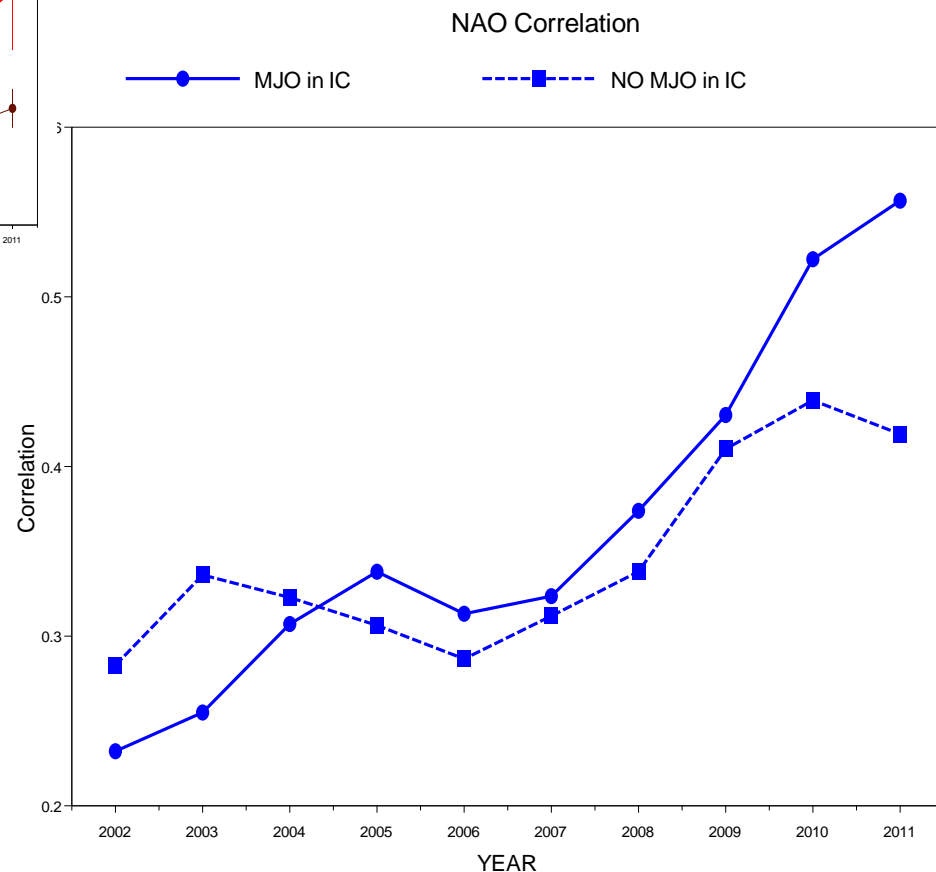

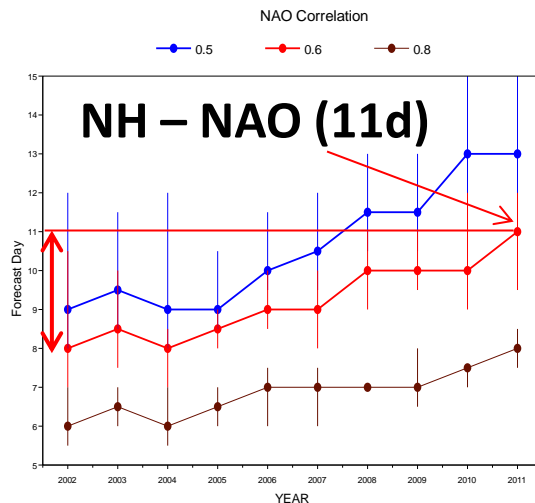

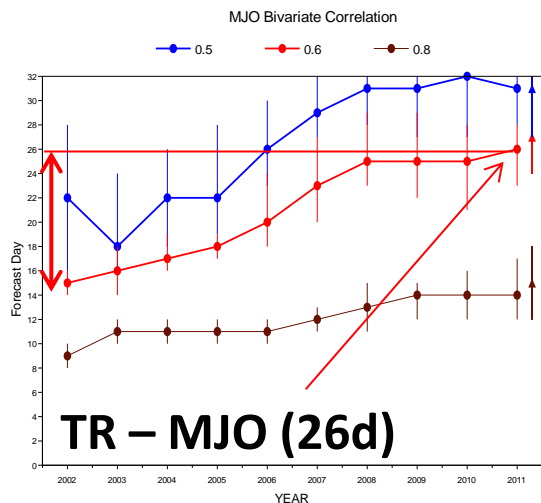

How does ENS perform in the sub-seasonal range? MJO

The ECMWF ensemble predicts the MJO up to about 25 days.

How does ENS perform in the sub-seasonal? MJO & NAO

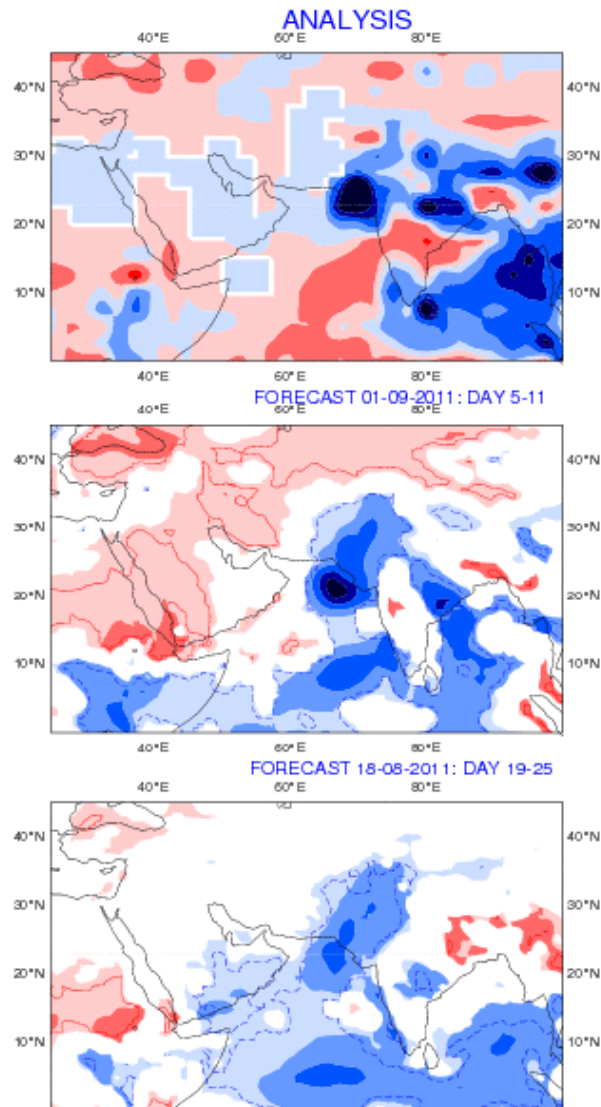

The skill of monthly forecasts have been continuously improving both in the tropics for the MJO (top left) and the extra-tropics for the NAO (top right).

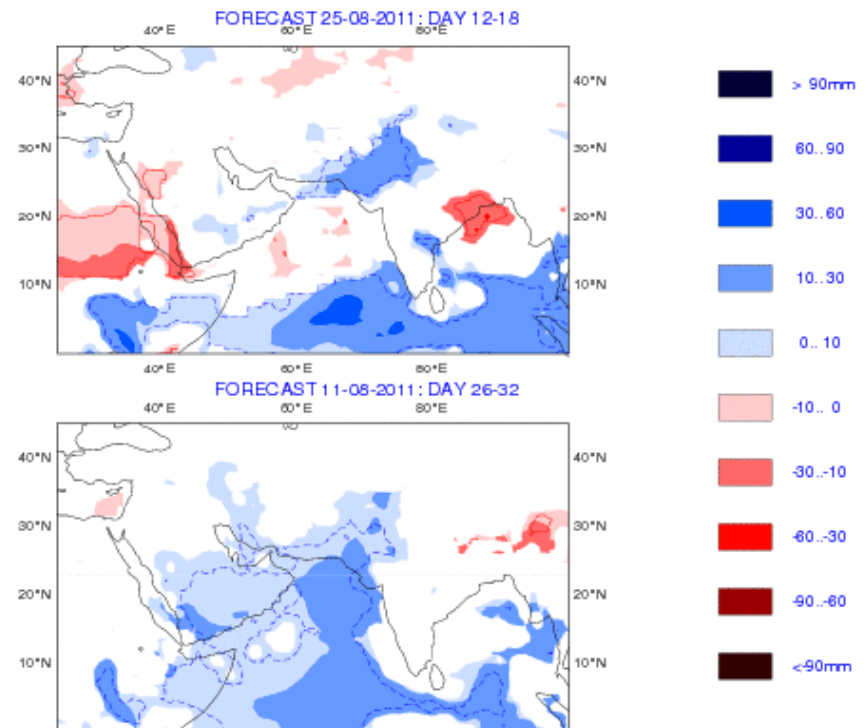

Improvements in the physics have led to better teleconnection between tropics and extra-tropics (bottom).

In some cases, precip events are predicted weeks ahead

Analysis and ECMWF EPS-Monthly Forecasting System
Precipitation anomaly
Verification period: 05-09-2011/TO/11-09-2011
ensemble size = 51 , climate size = 90
Shaded areas significant at 10% level
Contours at 1% level

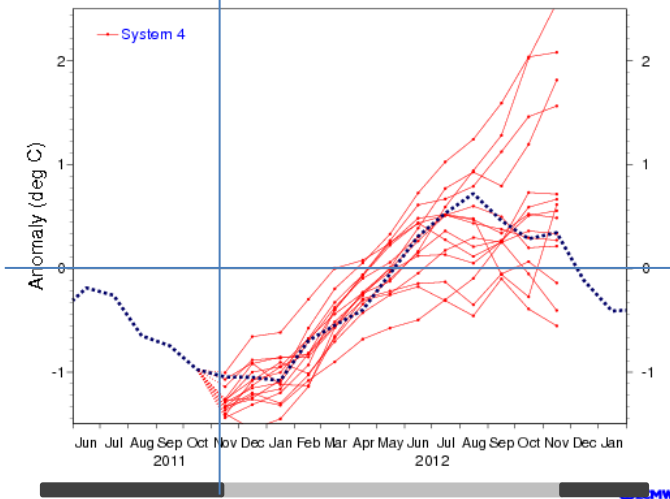

Seasonal system S4 provides probabilities up to 1y

The tropics remain the area where seasonal prediction has the highest skill, as indicated e.g. by the accuracy of 1-year forecasts of SST anomaly in the Nino3.4 area.

1 Nov '11 > Nov '12

SPI(MJJ) - ERA-I

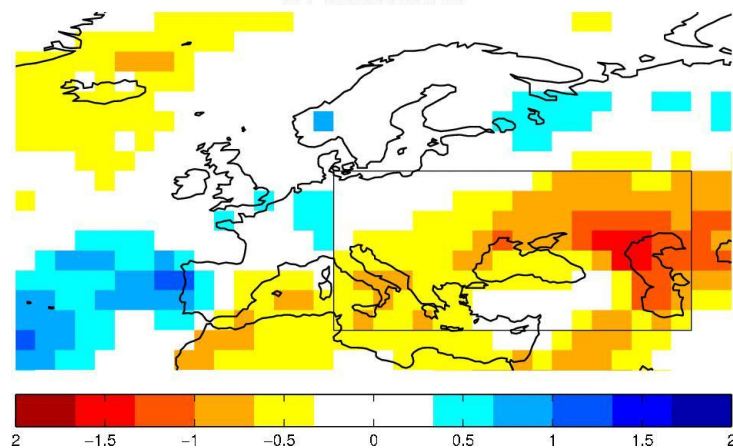

S4 SPI(MJJ) - 1Feb+456m

ECMWF seasonal forecast Jul 2012
SPI-3 issued 201202

S4 SPI(MJJ) - 1May+123m

ECMWF seasonal forecast Jul 2012
SPI-3 issued 201205

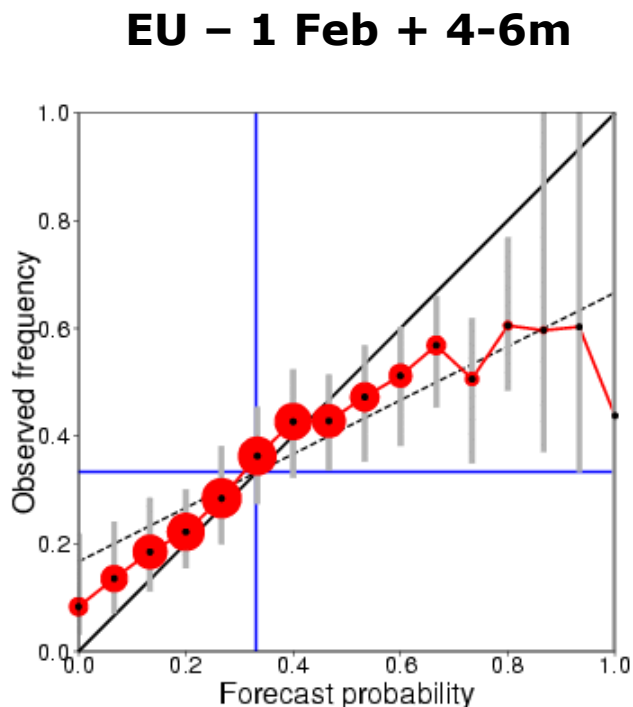

Est EU MJJ12.
Since Feb S4 predicts 75% probability of below normal conditions.

How does S4 perform in terms of reliability? 2mT

On average (30 years), 4-6 month probabilistic predictions of 2mT over North America and Europe started in Feb for MJJ (t+4-6m) are reliable and skilful compared to climatology (BSS>0).

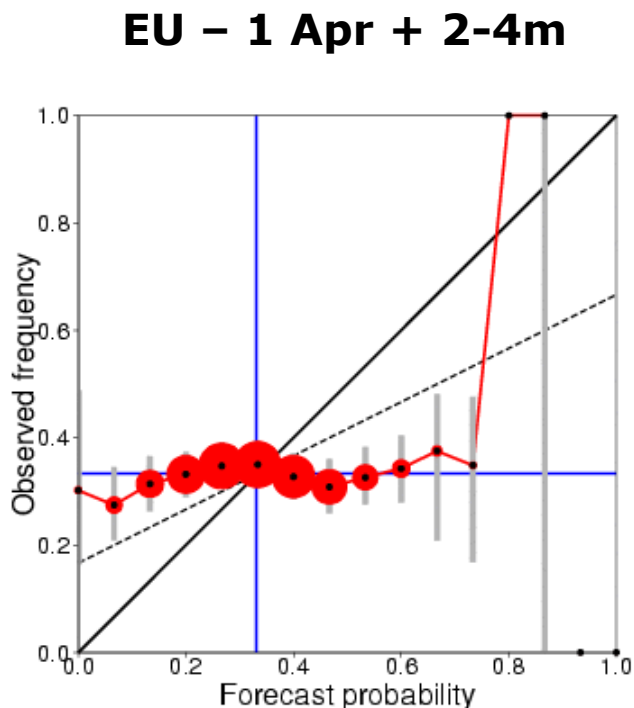

BSS PR(2mT>U3)	EU	NA
1 Feb > MJJ (t+ 4-6m)	0.064	0.050
1 Apr > MJJ (t+2-4m)	0.058	0.074

... but for precipitation, reliability is very poor!

On average (30 years), even shorter-range 2-4 month probabilistic predictions of TP over North America and Europe started in Apr for MJJ (t+2-4m) are **not** reliable and **less** skilful than climatology.

BSS PR(TP<L3)	EU	NA
1 Feb > MJJ (t+ 4-6m)	-0.049	-0.052
1 Apr > MJJ (t+2-4m)	-0.072	-0.052

EUROSIP: a multi-system approach for the seasonal range

In 2012, for the first time, European (ECMWF, Meteo France and UK Met Office) and American (NCEP) ensemble systems are used to generate operational products. This follows research that has shown that better and more reliable seasonal forecasts can be created by combining the output from several systems.

EUROSIP (33) v EUROSIP (44) - t+2-4M - 14y

(a) Europe

JJA 2011 & 2012 NEXRAD

(b) NAmerica

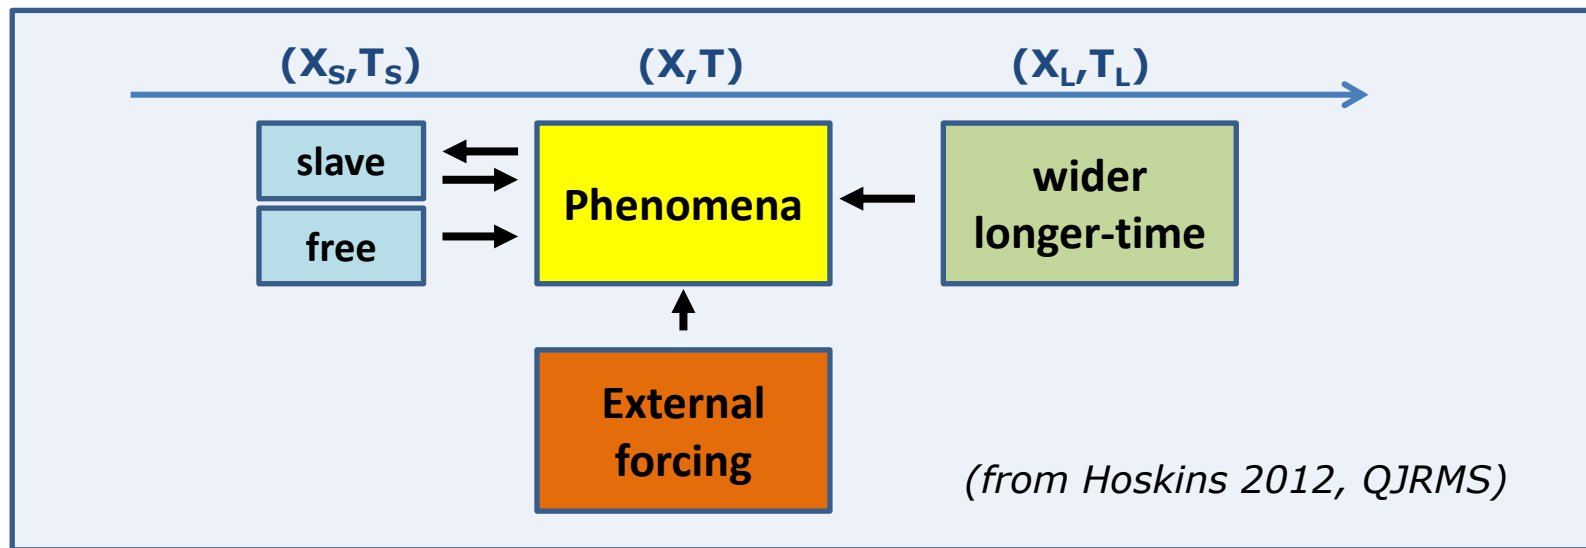

Nota: NEXRAD is calibrated with rain gauges, while EURRAD is not.

The main challenges: model processes and initialization

The main **challenges** that we are facing are:

- to design systems that simulate many scales and include all relevant processes, and
- to initialize the forecast integrations with accurate initial conditions.

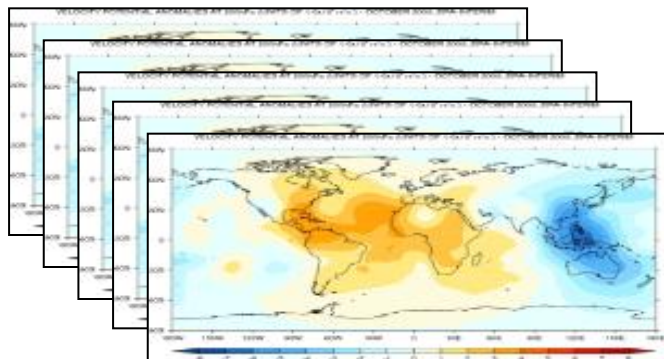

The future ...

The future: more reliable/better ENS to drive hydro apps

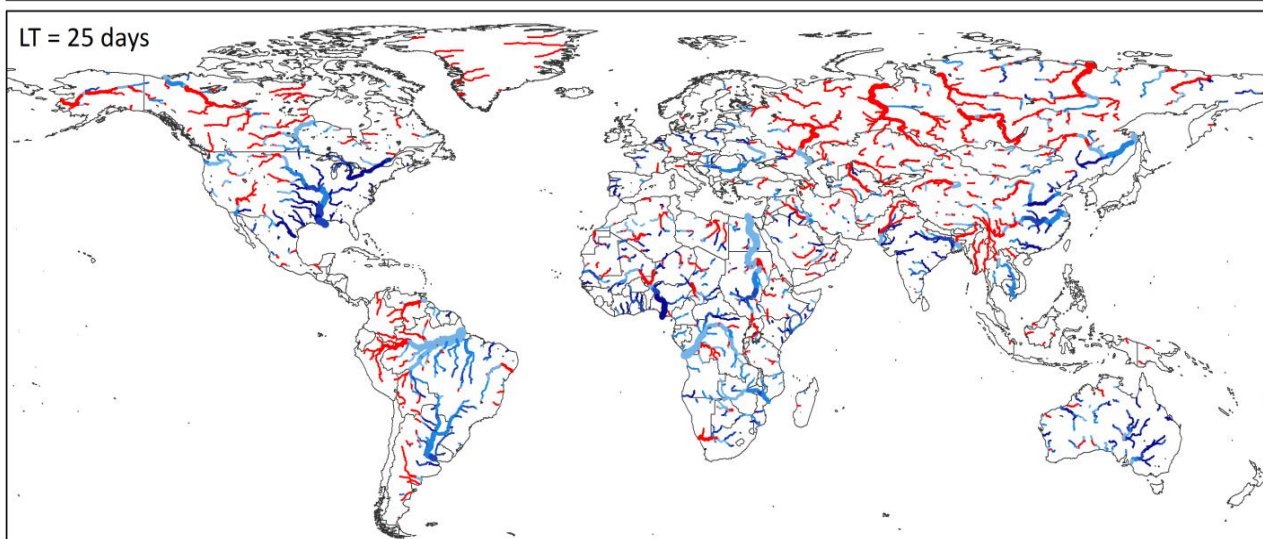

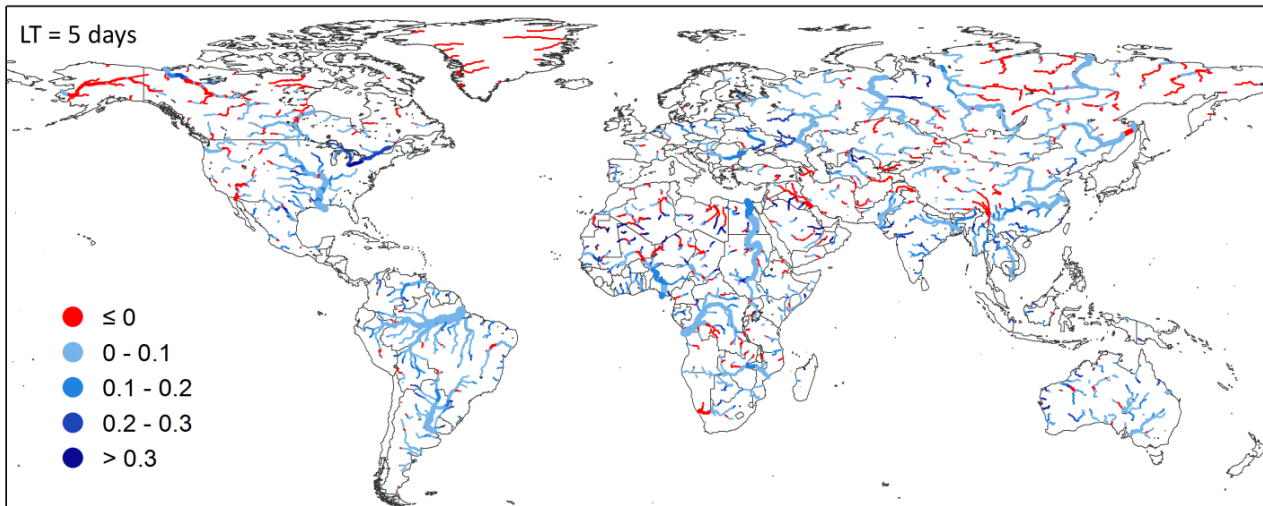

Global probabilistic weather forecast (ECMWF)

hydrological model

Validation against observed floods: 2-year experiment (2009-10)

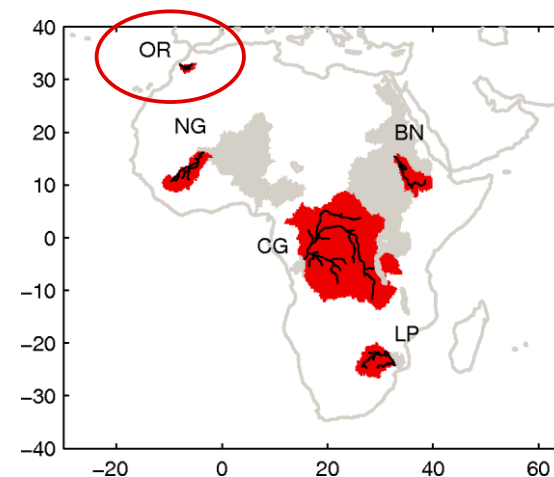

The future: more reliable/better ENS to predict droughts

A trial test focussing on 4 river basins using a blending to calculate the Standardised Precipitation Index (SPI).

In general, using S4 forecasts increases the skill of SPI forecasts (see e.g. BN, LP and NG).

- Blue Nile (BN)
- Congo (CG)
- Limpopo (LP)
- Upper Niger (NG)
- Oum er-rbia (OR)**

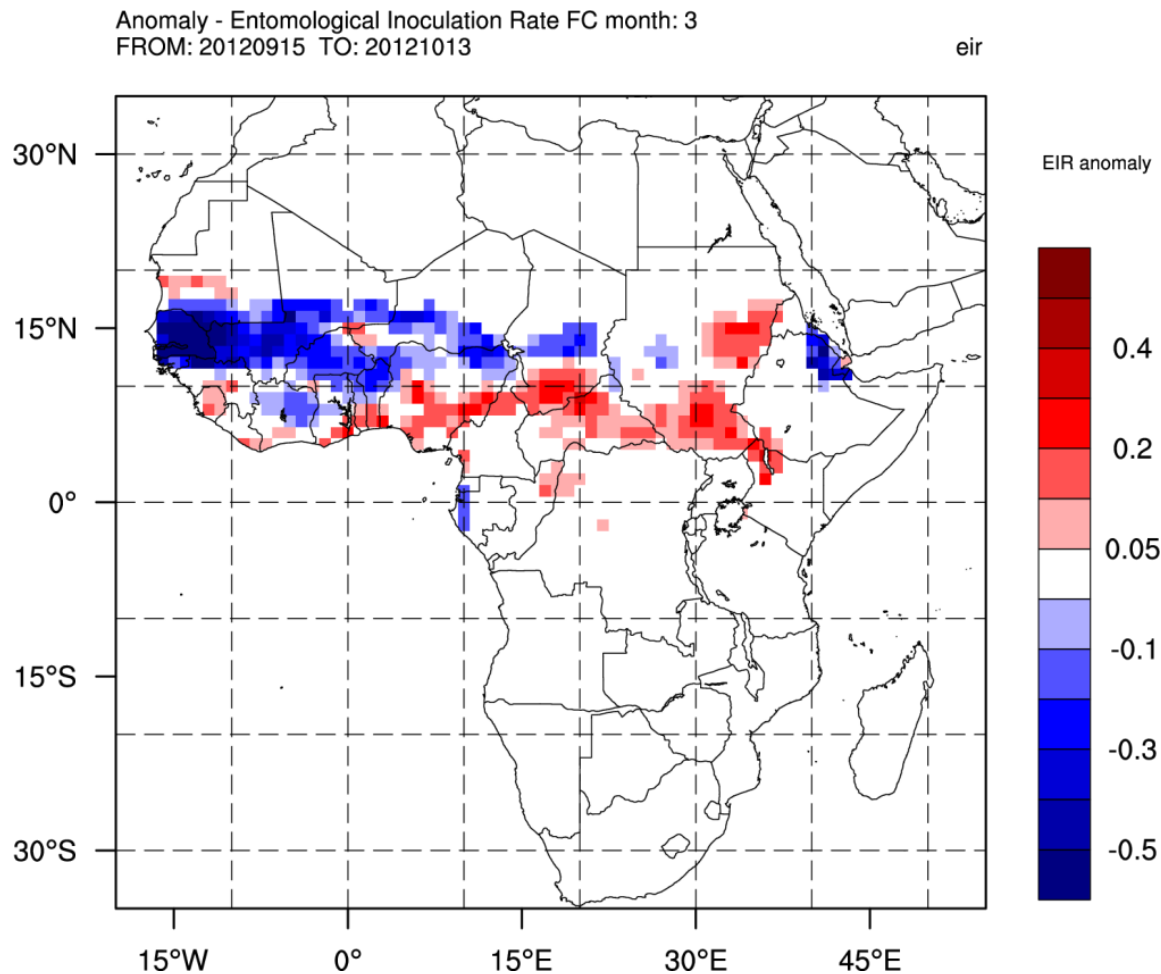

The future: more reliable/better ENS to drive health apps

ECMWF is helping users develop tailored applications in the health sector (**QWECI** project). This figure shows the first malaria outbreak forecast.

The figure shows a prototype 3m forecast for 15 Sep – 13 Oct 2012 of the Entomological Inoculation Rate (EIR) computed using the ICTP malaria model **VECTRI**, driven by S4 t+3m daily TP and T2m.

The future: more of the same or radical changes?

We aim to continue to improve and deliver more reliable and skilful forecasts. How?

- a) The NWP problem has to be addressed in **probabilistic terms**, and **ensembles** are the only practical tool to give us estimates of the PDF at initial and forecast times
- b) **Higher-resolution** is needed to resolve relevant scales
- c) **Better models** that include all relevant processes (i.e. fully coupled earth-system models) are also needed
- d) **Re-forecasts** are essential to estimate the model climate, thus to calibrate products
- e) As ensemble reliability and skill improves, **forecast length** will be extended
- f) Predicting in the medium (d3-10), the sub-seasonal (1m) and the seasonal range (6-12m) is **an initial value problem**: thus we need good quality initial conditions. *This is an area where the methods used to generate them might change ...*
- g) We need to improve the way we simulate **initial** (observation, DA assumptions, BC, ..) **and model uncertainties**. *The way we simulate them could also change ...*

The effective model resolution is only $\sim 8x$ the grid spacing

Going higher resolution: T_L3999 (5 km) wave fc (+72h)

72-hour forecast for significant wave height (colour shadings in metres) for 00 UTC on 30 October 2012 coupled to a 0.5° to 0.1° (fro T3999) global wave model.

Going higher resolution: T_L3999 (5 km) TP fc (+72h)

2013-05-31 to 2013-06-03

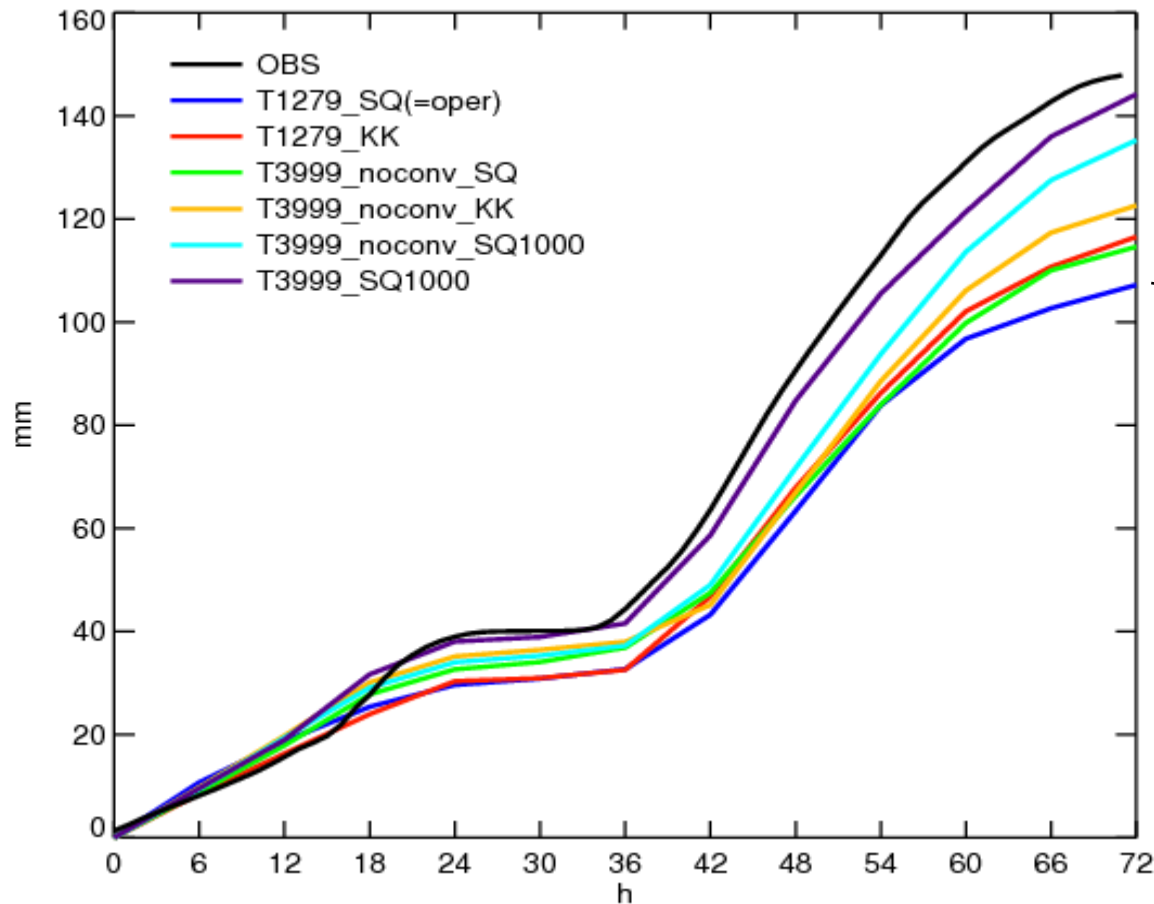

(from Fredrik Wetterhall)

The challenges we are facing

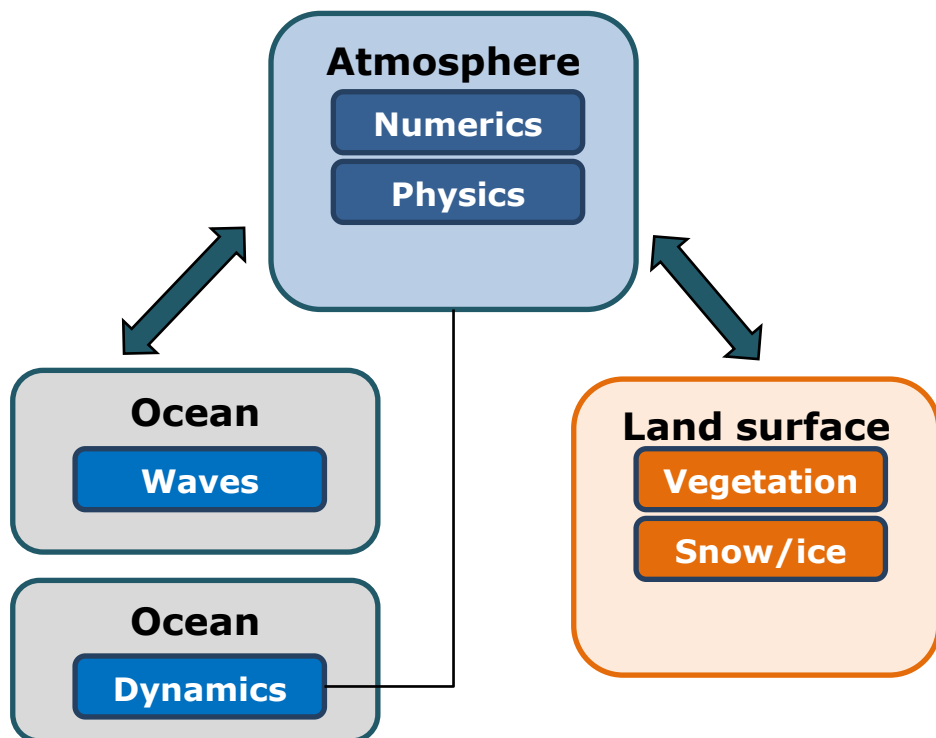

- ❖ Scalability
- ❖ Dynamical core
- ❖ Coupling (land/ocean/atmospheric composition/meteorology)
- ❖ Predictability and seamless ensembles (EDA/ENS/monthly/seasonal)
- ❖ DA science (mainstream/reanalysis; maximize use of observations, algorithms)
- ❖ Physical processes (resolved and unresolved)
- ❖ Climate monitoring (ERA, MACC)
- ❖ Feedback: core <-> applications
- ❖ Infrastructure and compute support to enable pioneering science
- ❖ Adaptability

Opportunities rely on building better coupled models ...

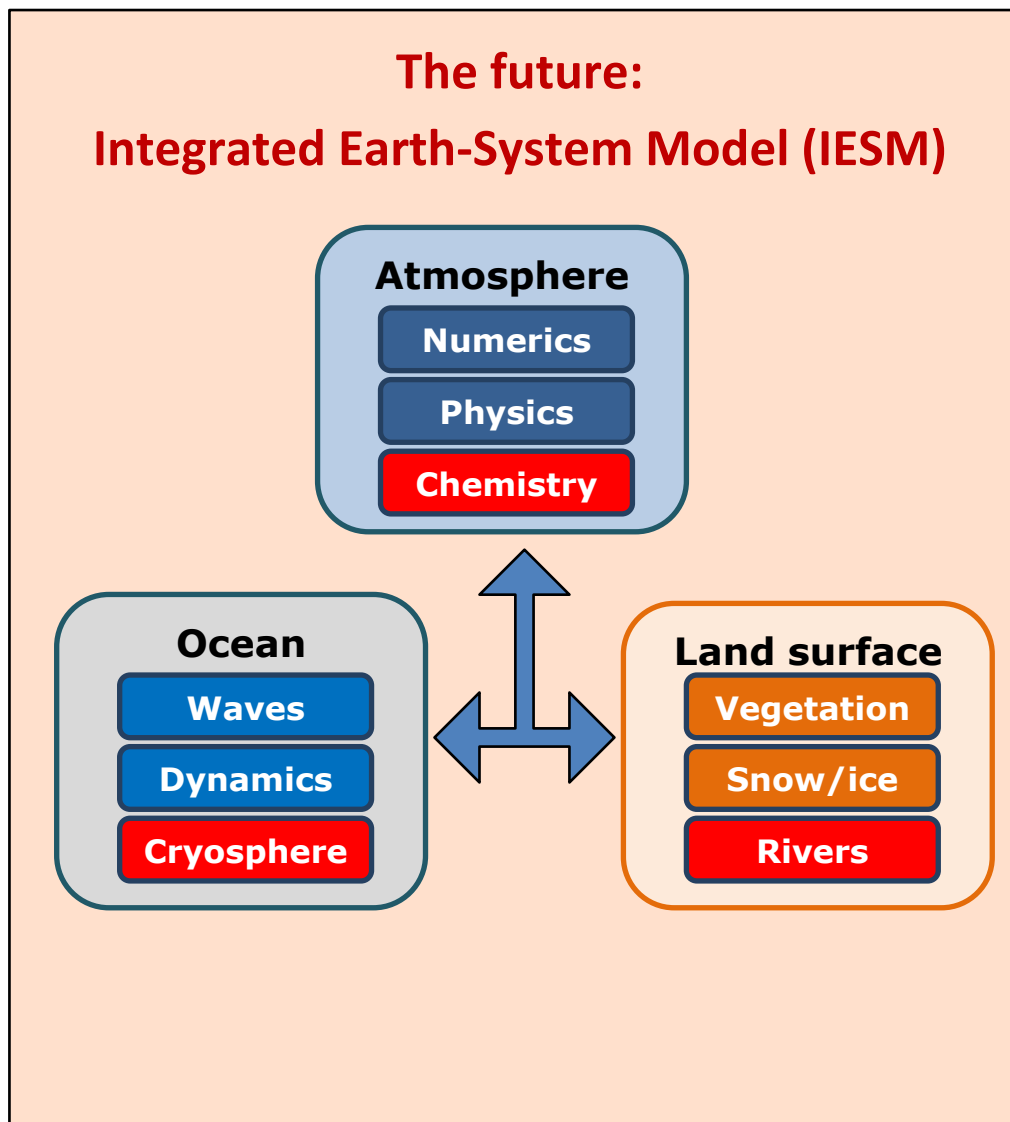

Today:

Integrated Forecasting System (IFS)

The future:

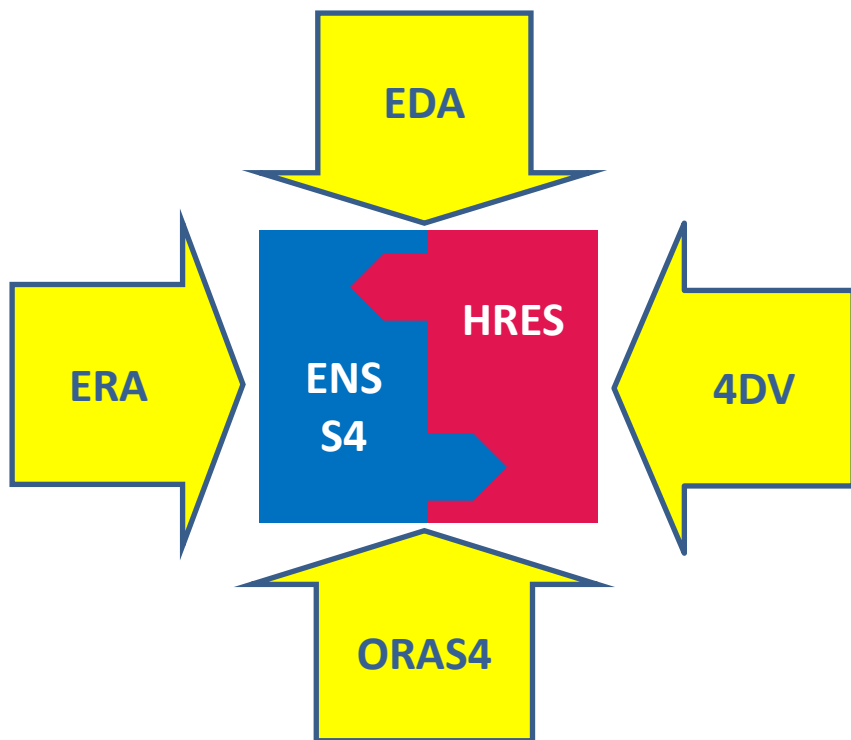

Integrated Earth-System Model (IESM)

... and on integrating/unifying the different components.
